A 43-year-old female client is receiving thyroid replacement hormone following a thyroidectomy. What adverse effects associated with thyroid hormone toxicity should the nurse instruct the client to report promptly to the healthcare provider?

- A) Tinnitus and dizziness.
- B) Tachycardia and chest pain.
- C) Dry skin and intolerance to cold.
- D) Weight gain and increased appetite. - Correct Answer: B. Thyroid replacement hormone increases the metabolic rate of all tissues, so common signs and symptoms of toxicity include tachycardia and chest pain (B). (A, C, and D) do not indicate a thyroid hormone toxicity.

A category X drug is prescribed for a young adult female client. Which instruction is most important for the nurse to teach this client?

- A) Use a reliable form of birth control.
- B) Avoid exposure to ultra violet light.
- C) Refuse this medication if planning pregnancy.
- D) Abstain from intercourse while on this drug. - Correct Answer: A. Drugs classified in the category X place a client who is in the first trimester of pregnancy at risk for teratogenesis, so women in the childbearing years should be counseled to use a reliable form of birth control (A) during drug therapy. (B) is not a specific precaution with Category X drugs. The client should be encouraged to discuss plans for pregnancy with the healthcare provider, so a safer alternative prescription (C) can be provided if pregnancy occurs. Although the risk of birth defects during pregnancy explains the restriction of these drugs during pregnancy, (D) is not indicated.
