

$$(g) \ 10x^7 - 30x^4 + 40x^2 - 15x.$$

$$(h) \ 3x^5 - 6x^3 + 12x + 6.$$

$$5. \begin{pmatrix} 8 & 3 & 1 \\ 3 & 0 & 0 \\ 3 & 0 & 0 \end{pmatrix} + \begin{pmatrix} 9 & 1 & 4 \\ 3 & 0 & 0 \\ 1 & 1 & 0 \end{pmatrix} = \begin{pmatrix} 17 & 4 & 5 \\ 6 & 0 & 0 \\ 4 & 1 & 0 \end{pmatrix}.$$

6.  $M = \begin{pmatrix} 4 & 2 & 1 & 3 \\ 5 & 1 & 1 & 4 \\ 3 & 1 & 2 & 6 \end{pmatrix}$ . Since all the entries has been doubled, we have  $2M$  can describe the inventory in June. Next, the matrix  $2M - A$  can describe the list of sold items. And the number of total sold items is the sum of all entries of  $2M - A$ . It equals 24.

7. It's enough to check  $f(0) + g(0) = 2 = h(0)$  and  $f(1) + g(1) = 6 = h(1)$ .
8. By (VS 7) and (VS 8), we have  $(a + b)(x + y) = a(x + y) + b(x + y) = ax + ay + bx + by$ .
9. For two zero vectors  $0_0$  and  $0_1$ , by Thm 1.1 we have that  $0_0 + x = x = 0_1 + x$  implies  $0_0 = 0_1$ , where  $x$  is an arbitrary vector. If for vector  $x$  we have two inverse vectors  $y_0$  and  $y_1$ . Then we have that  $x + y_0 = 0 = x + y_1$  implies  $y_0 = y_1$ . Finally we have  $0a + 1a = (0 + 1)a = 1a = 0 + 1a$  and so  $0a = 0$ .
10. We have sum of two differentiable real-valued functions or product of scalar and one differentiable real-valued function are again that kind of function. And the function  $f = 0$  would be the 0 in a vector space. Of course, here the field should be the real numbers.
11. All condition is easy to check because there is only one element.
12. We have  $f(-t) + g(-t) = f(t) + g(t)$  and  $cf(-t) = cf(t)$  if  $f$  and  $g$  are both even function. Furthermore,  $f = 0$  is the zero vector. And the field here should be the real numbers.
13. No. If it's a vector space, we have  $0(a_1, a_2) = (0, a_2)$  be the zero vector. But since  $a_2$  is arbitrary, this is a contradiction to the uniqueness of zero vector.
14. Yes. All the condition are preserved when the field is the real numbers.
15. No. Because a real-valued vector scalar multiply with a complex number will not always be a real-valued vector.
16. Yes. All the condition are preserved when the field is the rational numbers.
17. No. Since  $0(a_1, a_2) = (a_1, 0)$  is the zero vector but this will make the zero vector not be unique, it cannot be a vector space.
18. No. We have  $((a_1, a_2) + (b_1, b_2)) + (c_1, c_2) = (a_1 + 2b_1 + 2c_1, a_2 + 3b_2 + 3c_2)$  but  $(a_1, a_2) + ((b_1, b_2) + (c_1, c_2)) = (a_1 + 2b_1 + 4c_1, a_2 + 3b_2 + 5c_2)$ .

This book gives an introduction to the field of Incidence Geometry by discussing the basic families of point line geometries and introducing some of the mathematical techniques that are essential for their study. The families of geometries covered in this book include among others the generalized polygons, near polygons, polar spaces, dual polar spaces and designs. Also the various relationships between these geometries are investigated. Ovals and ovoids of projective spaces are studied and some applications to particular geometries will be given. A separate chapter introduces the necessary mathematical tools and techniques from graph theory. This chapter itself can be regarded as a self contained introduction to strongly regular and distance regular graphs. This book is essentially self contained only assuming the knowledge of basic notions from linear algebra and projective and affine geometry. Almost all theorems are accompanied with proofs and a list of exercises with full solutions is given at the end of the book. This book is aimed at graduate students and researchers in the fields of combinatorics and incidence geometry.

**Modern Control System Theory** M. Gopal, 1984. About the book: The book provides an integrated treatment of continuous time and discrete time systems for two courses at postgraduate level or one course at undergraduate and one course at postgraduate level. It covers mainly two areas of modern control theory namely system theory and multivariable and optimal control. The coverage of the former is quite exhaustive while that of latter is adequate with significant provision of the necessary topics that enables a research student to comprehend various technical papers. The stress is on interdisciplinary nature of the subject. Practical control problems from various engineering disciplines have been drawn to illustrate the potential concepts. Most of the theoretical results have been presented in a manner suitable for digital computer programming along with the necessary algorithms for numerical computations.

**Wavelets Made Easy** Yves Nievergelt, 2013-11-27. This book explains the nature and computation of mathematical wavelets which provide a framework and methods for the analysis and the synthesis of signals, images and other arrays of data. The material presented here addresses the audience of engineers, financiers, scientists and students looking for explanations of wavelets at the undergraduate level. It requires only a working knowledge or memories of a first course in linear algebra and calculus. The first part of the book answers the following two questions: What are wavelets? Wavelets extend Fourier analysis. How are wavelets computed? Fast transforms compute them. To show the practical significance of wavelets, the book also provides transitions into several applications: analysis, detection of crashes, edges or other events, compression, reduction of storage, smoothing, attenuation of noise and synthesis, reconstruction after compression or other modification. Such applications include one dimensional signals, sounds or other time series, two dimensional arrays, pictures or maps and three dimensional data, spatial diffusion. The applications demonstrated here do not constitute recipes for real implementations but aim only at clarifying and strengthening the understanding of the mathematics of wavelets.
