

Linear Induction Motor

- Linear Induction Motors (LIMs) generate linear motion using Faraday's Law of Electromagnetic Induction
- LIMs have a 'primary' (analogous to a stator) producing a magnetic field, and a 'secondary' (like a rotor) that's pushed by this field, creating linear motion
- They are used in maglev trains and industrial automation due to their direct linear motion and reduced wear
- However, while LIMs eliminate the need for mechanical conversions and are scalable, they are less efficient and costlier than rotational motors
