

# Electromagnetic (EM) Waves Study Guide

## Vocabulary / Concepts

**Electromagnetic Wave** - A transverse wave produced by the acceleration of charged particles. Electromagnetic waves are made up of magnetic fields and electric fields that are perpendicularly oriented. All electromagnetic waves travel at light speed (about  $3 \times 10^8$  m/s, or 300,000 km/s) in a vacuum.

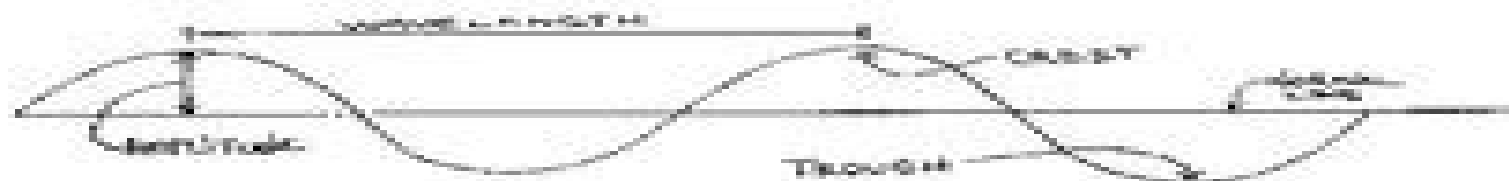

**Electromagnetic Spectrum** - This contains all the wavelength ranges of electromagnetic waves. EM waves are also referred to as "electromagnetic radiation".

**IMPORTANT:** The only difference between the wave ranges is wavelength and how the waves were produced! They are all made of the same stuff: electric and magnetic fields.

**EM Wave Ranges (listed from longest to shortest wavelength)**

- |                     |   |
|---------------------|---|
| 1) Radio            | → produced by electron acceleration in wires, plasmas, etc.   |
| 2) Infrared (IR)    | → produced by the vibrations of atoms and molecules. All matter in the universe emits it all the time.                                      |
| 3) Visible          | → produced by electrons jumping from a higher energy level to a lower energy level. Sunlight.   |
| 4) Ultraviolet (UV) | → Produced by electrons jumping from a higher energy level to a lower energy level. These jumps involve larger leaps than those in visible. |
| 5) X-ray            | → Produced by very large electron jumps from high energy levels to very low energy levels.  |
| 6) Gamma            | → Produced by proton accelerations caused by nuclear reactions.   |
- Note: A bracket on the left groups the last four categories (UV, X-ray, and Gamma) under the label 'Ionizing'.*

**Wave** - A wave is a disturbance that carries energy from one place to another place. Although EM waves don't actually look like this, we represent all waves as having the following characteristics:

**Waves and Oscillations** Walter Fox Smith, 2010-05-20 Waves and oscillations permeate virtually every field of current physics research are central to chemistry and are essential to much of engineering Furthermore the concepts and mathematical techniques used for serious study of waves and oscillations form the foundation for quantum mechanics Once they have mastered these ideas in a classical context students will be ready to focus on the challenging concepts of quantum mechanics when they encounter them rather than struggling with techniques This lively textbook gives a thorough grounding in complex exponentials and the key aspects of differential equations and matrix math no prior experience is assumed The parallels between normal mode analysis orthogonal function analysis especially Fourier analysis and superpositions of quantum states are clearly drawn without actually getting into the quantum mechanics An in depth accessible introduction to Hilbert space and bra ket notation begins in Chapter 5 on symmetrical coupled oscillators emphasizing the analogy with conventional dot products and continues in subsequent chapters Connections to current physics research atomic force microscopy chaos supersolids micro electro mechanical systems MEMS magnetic resonance imaging carbon nanotubes and more are highlighted in the text and in end of chapter problems and are frequently updated in the associated website The book actively engages readers with a refreshing writing style and a set of carefully applied learning tools such as in text
