

ENDOCRINE SYSTEM

Endocrine System: WORKING TOGETHER

Each organ system works on other systems within the body to do its "job". Our bodies learn just some of the ways that the endocrine system interacts with other organ systems.

Nervous System

Circulatory System

Endocrine System: FACTS

Endocrine System: PROBLEMS

Most of the time, the endocrine system works perfectly well. However, sometimes problems can arise.

Diabetes

Diabetes is a condition that causes high blood glucose (sugar) levels. It is caused by the body being unable to either produce or use the hormone insulin. So, the glucose in blood sugar gets stuck in the blood. Symptoms include increased thirst, weight gain, changes in vision, frequent urination, changes in mood, numbness or tingling in the hands.

Endocrine System: KEY TERMS

Term	Definition
Endocrine System	Network of endocrine glands that make, store, and release hormones.
Hormones	Chemical messengers that carry information and instructions from one cell to another.

Endocrine System: FUNCTIONS

The endocrine system is a network of glands that produce hormones. Hormones are the body's chemical messengers that carry information and instructions from one cell to another. Hormones control many, many important processes in our bodies.

Function of the Endocrine System

Endocrine System: HORMONES

Hormones are chemical signals. Hormones are released by a gland and travel through the bloodstream to target cells. When a target cell receives a hormone, it reacts in a specific way. Hormones can be thought of as the body's chemical messengers.

Endocrine System: FIGHT-OR-FLIGHT

The fight-or-flight response is a reaction that occurs in the body when we are really frightened. The body's fight-or-flight response is the body's way of reacting to a dangerous situation. When we are scared, our body's fight-or-flight response is triggered. This causes our heart to beat faster, our breathing to become deeper, and our muscles to become tense. This helps us to react quickly to a dangerous situation.

Endocrine System: GLANDS

A gland is a structure that produces and releases substances that perform a specific function in the body. There are many different types of glands in the body. Some glands are endocrine glands, which release hormones into the bloodstream. Other glands are exocrine glands, which release substances into the body through a duct.

Endocrine System: FEEDBACK LOOPS

Endocrine activities are regulated by complex feedback loops. These feedback loops help the body maintain a balance of hormones. When a hormone level is too high or too low, the body's feedback loop triggers a response to bring the level back to normal. This process is called a feedback loop.
