Arts, Bruce C. Wainmann, 2012-12-06 Although limnology is a young discipline it has over the past century experienced marked growth Its early descriptive period was a long one given the enormous diversity of biota and environments in freshwater ecosystems With the development of quantitative techniques came the ability to measure production rates and other parameters and to demonstrate the effects of nutrient limitation and predation on productivity and energy flow As understanding of these phenomena grew so too did our appreciation of the many complex chemical interactions among the biotic and habitat components of freshwater ecosystems A recent exciting phase of limnology which may be called biochemical limnology is evolving rapidly One of its many facets is the study of population and community dynamics at basic physiological levels Examples are many The integration of recent studies of food biochemistry with traditional studies of food quantity has begun to reveal the striking importance of food quality to reproduction and to the growth dynamics of many aquatic animals Positive as well as negative allelochemical interactions already known in terrestrial ecosystems are emerging as a major factor of many competitive interactions in fresh waters **Fennema's Food Chemistry** Srinivasan Damodaran, Kirk L. Lipid oxidation in food systems is one of the most important factors which affect food quality nutrition safety color and consumers acceptance The control of lipid oxidation remains an ongoing challenge as most foods constitute very complex matrices Lipids are mostly incorporated as emulsions and chemical reactions occur at various interfaces throughout the food matrix Recently incorporation of healthy lipids into food systems to deliver the desired nutrients is becoming more popular in the food industry Many food ingredients contain a vast array of components many of them unknown or constituting diverse or undefined molecular structures making the need in the food industry to develop effective approaches to mitigate lipid oxidation in food systems This book provides recent perspectives aimed at a better understanding of lipid oxidation mechanisms and strategies to improve the oxidative stability of food systems Five chapters on naturally derived antioxidants that focus on applications within food systems Contributors include an international group of leading researchers from academic industrial and governmental entities Discusses the oxidative stability of enzymatically produced oils and fats Provides overviews on the complexities of lipid oxidation mechanisms and emulsion systems most susceptible to rapid lipid oxidation
