based on the proceedings of a workshop that was an integral part of the 1991-92 IMA program on Applied Linear Algebra. Large systems of matrix equations arise frequently in applications and they have the property that they are sparse and well-structured. The purpose of this workshop was to bring together researchers in numerical analysis and various application areas to discuss where such problems arise and possible methods of solution. The last two days of the meeting were a celebration dedicated to Gene Golub on the occasion of his sixtieth birthday with the program arranged by Jack Dongarra and Paul van Dooren. We are grateful to Richard Brualdi, George Cybenko, Alan George, Gene Golub, Mitchell Luskin, and Paul Van Dooren for planning and implementing the year-long program. We especially thank Gene Golub, Anne Greenbaum, and Mitchell Luskin for organizing this workshop and editing the proceedings. The financial support of the National Science Foundation and the Minnesota Supercomputer Institute made the workshop possible.

New-Product Diffusion Models Vijay Mahajan, Eitan Muller, Yoram Wind, 2000-09-30

Product sales, especially for new products, are influenced by many factors. These factors are both internal and external to the selling organization and are both controllable and uncontrollable. Due to the enormous complexity of such factors, it is not surprising that product failure rates are relatively high. Indeed, new product failure rates have variously been reported as between 40 and 90 percent. Despite this multitude of factors, marketing researchers have not been deterred from developing and designing techniques to predict or explain the levels of new product sales over time. The proliferation of the internet, the necessity of developing a road map to plan the launch and exit times of various generations of a product, and the shortening of product life cycles are challenging firms to investigate market penetration or innovation diffusion models. These models not only provide information on new product sales over time but also provide insight on the speed with which a new product is being accepted by various buying groups such as those identified as innovators, early adopters, early majority, late majority, and laggards. *New Product Diffusion Models* aims to distill, synthesize, and integrate the best thinking that is currently available on the theory and practice of new product diffusion models. This state-of-the-art assessment includes contributions by individuals who have been at the forefront of developing and applying these models in industry. The book's twelve chapters are written by a combined total of thirty-two experts who together represent twenty-five different universities and other organizations in Australia, Europe, Hong Kong, Israel, and the United States. The book will be useful for researchers and students in marketing and technological forecasting, as well as those in other allied disciplines who study relevant aspects of innovation diffusion. Practitioners in high-tech and consumer durable industries should also gain new insights from *New Product Diffusion Models*. The book is divided into five parts: I Overview, II Strategic Global and Digital Environments for Diffusion Analysis, III Diffusion Models, IV Estimation, and V Applications and Software. The final section includes a PC-based

software program developed by Gary L Lilien and Arvind Rangaswamy 1998 to implement the Bass diffusion model A case on high definition television is included to illustrate the various features of the software A free 15 day trial access period for the updated software can be downloaded from <http://www.mktgeng.com/diffusionbook> Among the book's many highlights are chapters addressing the implications posed by the internet globalization and production policies upon diffusion of new products and technologies in the population
