**An Integrated Nonlinear Wind-Waves Model for Offshore Wind Turbines** Enzo Marino, 2010 This thesis presents a numerical model capable of simulating offshore wind turbines exposed to extreme loading conditions External condition based extreme responses are reproduced by coupling a fully nonlinear wave kinematic solver with a hydro aero elastic

simulator First a two dimensional fully nonlinear wave simulator is developed The transient nonlinear free surface problem is formulated assuming the potential theory and a high order boundary element method is implemented to discretize Laplace's equation For temporal evolution a second order Taylor series expansion is used The code after validation with experimental data is successfully adopted to simulate overturning plunging breakers which give rise to dangerous impact loads when they break against wind turbine substructures Emphasis is then placed on the random nature of the waves Indeed through a domain decomposition technique a global simulation framework embedding the numerical wave simulator into a more general stochastic environment is developed The proposed model is meant as a contribution to meet the more and more pressing demand for research in the offshore wind energy sector as it permits taking into account dangerous effects on the structural response so as to increase the global structural safety level **The Publishers' Trade List Annual**, 1985

**Analytical Methods in Marine Hydrodynamics** Ioannis K. Chatjigeorgiou, 2018-05-31 The value of analytical solutions relies on the rigorous formulation and a strong mathematical background This comprehensive volume unifies the most important geometries which allow for the development of analytical solutions for hydrodynamic boundary value problems It offers detailed explanations of the Laplace domain and numerical results associated with such problems providing deep insight into the theory of hydrodynamics Extended numerical calculations are provided and discussed allowing the reader to use them as benchmarks for their own computations and making this an invaluable resource for specialists in various disciplines including hydrodynamics acoustics optics electrostatics and brain imaging **Ocean Acoustics** J.A. DeSanto, 2013-11-11 This Topics volume is devoted to a study of sound propagation in the ocean The effect of the interior of the ocean on underwater sound is analogous to the effect of a lens on light The oceanic lens is related as in light propagation to the index of refraction of the medium The latter is given by the ratio of the sound frequency to the speed of sound in water typically about 1500 m/s It is the variation of the sound speed due to changing temperature density salinity and pressure in the complex ocean environment which creates the lens effect Many oceanic processes such as currents tides eddies circulating translating regions of water and internal waves the wave like structure of the oceanic density variability contribute in turn to the changes in sound speed The net effect of the ocean lens is to trap and guide sound waves in a channel created by the lens The trapped sound can then propagate thousands of miles in this oceanic waveguide In addition to the propagation in the interior of the ocean sound can propagate into and back out of the ocean bottom as well as scatter from the ocean surface Just as the sound produced by a loudspeaker in a room is affected by the walls of the room so the ocean boundaries and the material properties below the ocean bottom are essential ingredients in the problem **Renewable Energies Offshore** C. Guedes Soares, 2015-09-07 Renewable Energies Offshore includes the papers presented in the 1st International Conference on Renewable Energies Offshore RENEW2014 held in Lisbon 24-26 November 2014 The conference is a consequence of the importance of the offshore renewable energies worldwide and an opportunity to contribute to the
