

ENDOCRINE SYSTEM

Endocrine System: WORKING TOGETHER

Each organ system works on other systems within the body to do its "job". See below to learn just some of the ways that the endocrine system interacts with other organ systems.

Nervous System

Circulatory System

Endocrine System: FACTS

Endocrine System: PROBLEMS

Most of the time, the endocrine system works perfectly well. However, sometimes problems can arise.

Diabetes

Diabetes is a condition that causes high blood glucose (sugar) levels. It is caused by the body being unable to either produce or use the hormone insulin. So, the glucose (sugar) gets stuck in the blood. Symptoms include increased thirst, weight loss, frequent urination, blurred vision, slow wound healing, and changes in mood. Diabetes can lead to long-term complications such as heart disease, kidney failure, and blindness.

Endocrine System: KEY TERMS

Term	Definition
Endocrine System	Network of endocrine glands that make, store, and release hormones.
Hormones	Chemical messengers that carry information and instructions from one cell to another.

Endocrine System: HORMONES

Hormones are chemical signals. Hormones are released into the bloodstream by endocrine glands. They travel through the bloodstream to target cells, where they bind to receptors and cause a response. Hormones can affect many different parts of the body, including growth, metabolism, and reproduction.

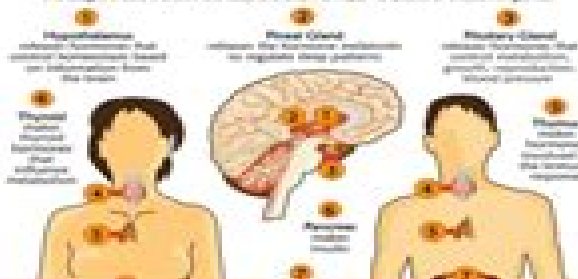

Endocrine System: FIGHT-OR-FLIGHT

The fight-or-flight response is a reaction that occurs in the body when we are really frightened. The hormone **adrenaline** (also known as **epinephrine**) is released by the adrenal glands. Adrenaline makes the heart beat faster, increases blood pressure, and releases glucose from the liver. This gives the body the energy it needs to either fight or flee. The fight-or-flight response is a survival mechanism that helps the body respond quickly to danger.

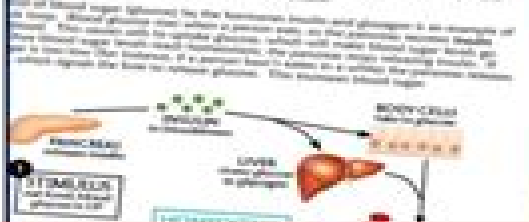

Endocrine System: GLANDS

A **gland** is a structure that produces and releases substances that perform a specific function in the body. Some glands, like the **salivary glands**, release substances directly into the body. Other glands, like the **endocrine glands**, release substances into the bloodstream. Endocrine glands include the **hypothalamus**, **pituitary gland**, **thyroid gland**, **parathyroid glands**, **adrenal glands**, **pancreas**, **ovaries**, and **testes**.

Endocrine System: FEEDBACK LOOPS

Endocrine activities are regulated by complex feedback loops. These feedback loops help the body maintain a balance of hormones. When a hormone level is too high or too low, the body sends a signal to the endocrine system to adjust the level. This signal is often sent by the hypothalamus and pituitary gland. The feedback loop then acts on the target organ to either increase or decrease the hormone level.
