

Living Systems Study Guide

The organization of a community is based on the utilization of the energy from the sun within a given ecosystem. The community is also defined by the interrelated niches within it.

Within a community, organisms are dependent on the survival of other organisms. Energy is passed from one organism to another.

Food Chain: Energy cycles, and is passed, from the sun to a producer (ex: plants) to a consumer (ex: cow) and back into the nutrient pool through decomposers (ex: mushrooms). The greatest amount of energy in a community is in the producers.

Vocabulary:

Habitat – The place in which an animal or plant naturally lives, which provides food, water, shelter, and space. The size of the habitat depends on the organism's needs.

Organism – any living thing

Niches - The function that an organism performs in the food web of that community; it includes everything that an organism does and needs in its environment. (No two types of organisms can occupy exactly the same niche in a community. During an animal's life cycle, its niche can change. For example: What the animal eats, what eats it, and other relationships.)

Ecosystem – groups of living things and the environment they live in; includes the ways living things interact with other living things and non-living things

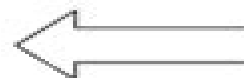

Community – a group of organisms that share an environment

Life Cycle – the various stages of life (ex: egg, tadpole, frog)

Humans have a major impact on ecosystems:

Positive Impacts

Negative Impacts
