**Virtualization** Edouard Bugnion,Jason Nieh,Dan Tsafir,2022-06-01 This book focuses on the core question of the necessary architectural support provided by hardware to efficiently run virtual machines and of the corresponding design of the hypervisors that run them Virtualization is still possible when the instruction set architecture lacks such support but the hypervisor remains more complex and must rely on additional techniques Despite the focus on architectural support in current architectures some historical perspective is necessary to appropriately frame the problem The first half of the book provides the historical perspective of the theoretical framework developed four decades ago by Popek and Goldberg It also describes earlier systems that enabled virtualization despite the lack of architectural support in hardware As is often the case theory defines a necessary but not sufficient set of features and modern architectures are the result of the combination of the theoretical framework with insights derived from practical systems The second half of the book describes state of the art support for virtualization in both x86 64 and ARM processors This book includes an in depth description of the CPU memory and I O virtualization of these two processor architectures as well as case studies on the Linux KVM VMware and Xen

hypervisors It concludes with a performance comparison of virtualization on current generation x86 and ARM based systems across multiple hypervisors
