

**1-5 Study Guide and Intervention****Parent Functions and Transformations**

**Parent Functions** A parent function is the simplest of the functions in a family.

| Parent Function           | Form                       | Notes                                                                             |
|---------------------------|----------------------------|-----------------------------------------------------------------------------------|
| constant function         | $f(x) = c$                 | graph is a horizontal line                                                        |
| identity function         | $f(x) = x$                 | points on graph have coordinates $(a, a)$                                         |
| quadratic function        | $f(x) = x^2$               | graph is U-shaped                                                                 |
| cubic function            | $f(x) = x^3$               | graph is symmetric about the origin                                               |
| square root function      | $f(x) = \sqrt{x}$          | graph is in first quadrant                                                        |
| reciprocal function       | $f(x) = \frac{1}{x}$       | graph has two branches                                                            |
| absolute value function   | $f(x) =  x $               | graph is V-shaped                                                                 |
| greatest integer function | $f(x) = \lfloor x \rfloor$ | defined as the greatest integer less than or equal to $x$ ; type of step function |

**Example**

Describe the following characteristics of the graph of the parent function  $f(x) = x^3$ : domain, range, intercepts, symmetry, continuity, end behavior, and intervals on which the graph is increasing/decreasing.

The graph confirms that  $D = \{x|x \in \mathbb{R}\}$  and  $R = \{y|y \in \mathbb{R}\}$ .

The graph intersects the origin, so the  $x$ -intercept is 0 and the  $y$ -intercept is 0.

It is symmetric about the origin and it is an odd function:

$$f(-x) = -f(x).$$

The graph is continuous because it can be traced without lifting the pencil off the paper.

As  $x$  decreases,  $y$  approaches negative infinity, and as  $x$  increases,  $y$  approaches positive infinity.

$$\lim_{x \rightarrow -\infty} f(x) = -\infty \text{ and } \lim_{x \rightarrow \infty} f(x) = \infty$$

The graph is always increasing, so it is increasing for  $(-\infty, \infty)$ .

**Exercise**

Describe the following characteristics of the graph of the parent function  $f(x) = x^3$ : domain, range, intercepts, symmetry, continuity, end behavior, and intervals on which the graph is increasing/decreasing.
