

Figure 9-13 The basic 555-timer configuration for a 50% duty cycle (variable)

### 555 Astable Mode

A basic schematic for a 555 timer running in an astable mode is shown in Figure 9-13. Once again, an LED is attached to the output for demonstration purposes. If the pulse may exceed the pin ratings of most, a small loadspeaker can be used instead, in series with a 470-ohm resistor and a 100V capacitor.

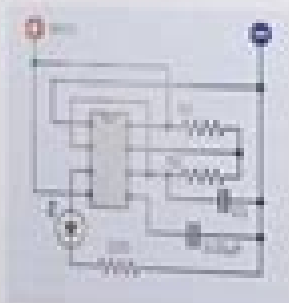

Figure 9-14 A 555 timer with variable duty cycle and approximately 50% duty cycle (variable)

### Separate Control of High and/or Output Times

In Figure 9-15, a 555 timer has been set up around  $R_2$ . The capacitor now charges only through  $R_1$ , so the timer has a much lower timing constant (than  $R_2$ ). It discharges through  $R_2$ , so the discharge constant is shorter. Consequently, the length of the output pulse can be adjusted with the value  $R_1$  only, while the length of the low output can be adjusted with the value of  $R_2$  only. duration of the high output can be seen by or equals the duration of the low output etc. is not possible with the basic configuration components in Figure 9-13.

Figure 9-15 In this circuit, a dual potentiometer can be used to adjust the "on" time and the "off" time of the 555 timer and 50% independently of each other with  $R_1$  and  $R_2$  resistors.

### 555 Fifty Percent Astable Duty Cycle: 1

In Figure 9-16, the circuit enables a 50% duty cycle output duration of approximately 50% again 50% low. Initially,  $C_1$  has no charge (only input of the timer low, and causing the output cycle with a high pulse from the Output pin).

Since in this demonstration circuit, the output illuminates an LED. At the same time, capacitor  $C_1$  is precharged to the output and charges  $C_1$ . When the voltage on  $C_1$  reaches 2/3 of  $V_{cc}$ , this is compared to the threshold input, which causes the "high" cycle and initiates the output on the Output pin. This starts to take the charge from  $C_1$  through  $R_1$ . When the voltage drops to 1/3  $V_{cc}$ , this initiates a new cycle. Because only one resistor is used to charge and discharge the capacitor, as may imagine that the charge and discharge times should be identical. However, a higher load on the output will probably pull down the output voltage to some extent, lengthening the charge time. Consequently, a load on the Output pin that has low resistance will probably take at least some of the charge from the capacitor during the discharge cycle.

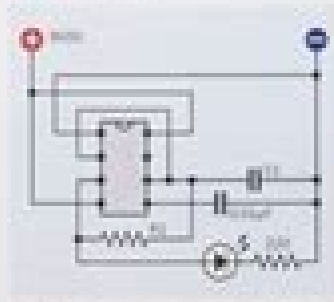

Figure 9-16 The configuration enables an approximately 50% on/off duty cycle at the output pin, although the potentiometer can adjust the duty.

### 555 Fifty Percent Astable Duty Cycle: 2

In Figure 9-17, a small modification of the basic astable circuit shown in Figure 9-14 provides an other way to enable a 50% duty cycle. Compare the two schematics, and you will see that just the connection between  $R_1$  and  $R_2$  has been altered so that  $C_1$  now charges only through  $R_1$ , and dis-

charges only through  $R_2$ . However, in this configuration the capacitor is discharging into a variable divider caused by the two resistors. Slight adjustments of the resistor values may be necessary before the duty cycle is precisely 50%.

Figure 9-17 In previous configuration to provide an adjustable duty cycle, only one potentiometer.

### Use of the 555 Control Pin

In Figure 9-18, a potentiometer and two series resistors allow a varying voltage to be applied to the Control Pin. This will lengthen or reduce both the charge and the discharge times of the timing capacitor. If values for the capacitor and its associated resistors are chosen to create a frequency of approximately 100Hz, a 100 potentiometer should demonstrate more than an octave of an octave through the loadspeaker. Other components can be substituted for experimentation creating possibilities for producing pulse width modulation. Alternatively, if a large capacitor is added between the Control pin and ground while a second 100 timer, running slowly in an astable mode, applies its output to the Control pin, the charging and discharging of the capacitor will apply a smoothly rising and falling voltage. If the fast 555 timer is running at an audio frequency, the output will have a "beating tone" effect.
