

Assignment 2 – Plate Tectonics and the Origin of Volcanic Igneous Rocks

Objectives

1. **Identify** the three types of plate boundaries and the characteristic features of each in terms of tectonic movement, direction of magma flow, and the types of igneous rocks that form.

2. **Explain** the relationship between plate boundaries and the origin of volcanic igneous rocks.

3. **Identify** the three types of plate boundaries and the characteristic features of each in terms of tectonic movement, direction of magma flow, and the types of igneous rocks that form.

Introduction

Plate tectonics is the study of the movement of the Earth's crust. The crust is the uppermost layer of the Earth, and it is made up of large blocks of rock called plates. These plates move around the Earth, and their movement is responsible for many of the geological features we see today, including mountains, volcanoes, and earthquakes. The study of plate tectonics is a relatively new field, but it has become one of the most important areas of research in geology.

There are three main types of plate boundaries: divergent, convergent, and transform. At a divergent boundary, two plates move apart from each other. This can happen at a mid-ocean ridge, where new oceanic crust is formed, or at a continental rift, where the crust is being pulled apart. At a convergent boundary, two plates move toward each other. This can happen at a subduction zone, where one plate is forced under another, or at a collision zone, where two continental plates collide. At a transform boundary, two plates slide past each other horizontally.

Volcanic igneous rocks are formed from magma that has cooled and solidified. Magma is a hot, molten material that is composed of silicate minerals and gases. It is formed in the mantle of the Earth, and it can rise to the surface through a vent or fissure to form a volcano. The type of volcanic igneous rock that forms depends on the composition of the magma and the conditions under which it cooled.
