Financial Modeling Stephane Crepey, 2013-06-13 Backward stochastic differential equations BSDEs provide a general mathematical framework for solving pricing and risk management questions of financial derivatives. They are of growing importance for nonlinear pricing problems such as CVA computations that have been developed since the crisis. Although BSDEs are well known to academics, they are less familiar to practitioners in the financial industry. In order to fill this gap, this book revisits financial modeling and computational finance from a BSDE perspective, presenting a unified view of the pricing and hedging theory across all asset classes. It also contains a review of quantitative finance tools including Fourier techniques, Monte Carlo methods, finite differences, and model calibration schemes. With a view to use in graduate courses in computational finance and financial modeling, corrected problem sets and Matlab sheets have been provided. Stéphane Crepey's book starts with a few chapters on classical stochastic processes, material and then fasten your seatbelt: the author starts traveling backwards in time through backward stochastic differential equations BSDEs. This does not mean that one has to read the book backwards like a manga. Rather, the possibility to move backwards in time, even if from a variety of final scenarios following a probability law, opens a multitude of possibilities for all those pricing problems whose solution is not a straightforward expectation. For example, this allows for framing problems like pricing with credit and funding costs in a rigorous mathematical setup. This is as far as I know, the first book written for several levels of audiences with applications to financial modeling and using BSDEs as one of the main tools, and as the song says, it's never as good as the first time. Damiano Brigo, Chair of Mathematical Finance, Imperial College London. While the classical theory of arbitrage-free pricing has matured and is now well understood and used by the finance industry, the theory of BSDEs continues to enjoy a rapid growth and remains a domain restricted to academic researchers and a handful of practitioners. Crepey's book presents this novel approach to a wider community of researchers involved in mathematical modeling in finance. It is clearly an essential reference for anyone interested in the latest developments in financial mathematics. Marek Musiela, Deputy Director of the Oxford Man Institute of Quantitative Finance.

R Programming and Its Applications in Financial Mathematics Shuichi Ohsaki, Jori Ruppert-Felsot, Daisuke Yoshikawa, 2018-01-31 This book provides an introduction to R programming and a summary of financial mathematics It is not always easy for graduate

students to grasp an overview of the theory of finance in an abstract form For newcomers to the finance industry it is not always obvious how to apply the abstract theory to the real financial data they encounter Introducing finance theory alongside numerical applications makes it easier to grasp the subject Popular programming languages like C which are used in many financial applications are meant for general purpose requirements They are good for implementing large scale distributed systems for simultaneously valuing many financial contracts but they are not as suitable for small scale ad hoc analysis or exploration of financial data The R programming language overcomes this problem R can be used for numerical applications including statistical analysis time series analysis numerical methods for pricing financial contracts etc This book provides an overview of financial mathematics with numerous examples numerically illustrated using the R programming language

American-Type Options Dmitrii S. Silvestrov, 2013-11-27 The book gives a systematical presentation of stochastic approximation methods for models of American type options with general pay off functions for discrete time Markov price processes Advanced methods combining backward recurrence algorithms for computing of option rewards and general results on convergence of stochastic space skeleton and tree approximations for option rewards are applied to a variety of models of multivariate modulated Markov price processes The principal novelty of presented results is based on consideration of multivariate modulated Markov price processes and general pay off functions which can depend not only on price but also an additional stochastic modulating index component and use of minimal conditions of smoothness for transition probabilities and pay off functions compactness conditions for log price processes and rate of growth conditions for pay off functions The book also contains an extended bibliography of works in the area This book is the first volume of the comprehensive two volumes monograph The second volume will present results on structural studies of optimal stopping domains Monte Carlo based approximation reward algorithms and convergence of American type options for autoregressive and continuous time models as well as results of the corresponding experimental studies
