## Copying a Segment

Sketch, draw, and construct a segment congruent to  $\overline{MN}$ .

**Step 1** Estimate and sketch.

Estimate the length of  $\overline{MN}$  and sketch  $\overline{PQ}$  approximately the same length.

**Step 2** Measure and draw.

Use a ruler to measure  $\overline{MN}$ .  $MN$  appears to be 3.1 cm. Use a ruler and draw  $\overline{XY}$  to have length 3.1 cm.

**Step 3** Construct and compare.

Use a compass and straightedge to construct  $\overline{ST}$  congruent to  $\overline{MN}$ .

A ruler shows that  $\overline{PQ}$  and  $\overline{XY}$  are approximately the same length as  $\overline{MN}$ , but  $\overline{ST}$  is precisely the same length.

2. Sketch, draw, and construct a segment congruent to  $\overline{JK}$ .

**Geometry Through the Circle** James Richard King, 1996

*Geometry in Problems* Alexander Shen, 2016 Classical Euclidean geometry with all its triangles circles and inscribed angles remains an excellent playground for high school mathematics students even if it looks outdated from the professional mathematician's viewpoint. It provides an excellent choice of elegant and natural problems that can be used in a course based on problem solving. The book contains more than 750 mostly easy but nontrivial problems in all areas of plane geometry and solutions for most of them as well as additional problems for self study some with hints. Each chapter also provides concise reminders of basic notions used in the chapter so the book is almost self contained although a good textbook and competent teacher are always recommended. More than 450 figures illustrate the problems and their solutions. The book can be used by motivated high school students as well as their teachers and parents. After solving the problems in the book the student will have mastered the main notions and methods of plane geometry and hopefully will have had fun in the process. In the interest of fostering a greater awareness and appreciation of mathematics and its connections to other disciplines and everyday life MSRI and the AMS are publishing books in the Mathematical Circles Library series as a service to young people their parents and teachers and the mathematics profession. What a joy Shen's *Geometry in Problems* is a gift to the school teaching world. Beautifully organized by content topic Shen has collated a vast collection of fresh innovative and highly classroom relevant questions problems and challenges sure to enliven the minds and clever thinking of all those studying Euclidean geometry for the first time. This book is a spectacular resource for educators and students alike. Users will not only sharpen their mathematical understanding of specific topics but will also sharpen their problem solving wits and come to truly own the mathematics explored. Also Math Circle leaders can draw much inspiration for session ideas from the material presented in this book. James Tanton Mathematician at Large Mathematical Association of America We learn mathematics best by doing mathematics. The author of this book recognizes this principle. He invites the reader to participate in learning plane geometry through carefully chosen problems with brief explanations leading to much activity. The problems in the book are sometimes deep and subtle almost everyone can do some of them and almost no one can do all. The reader comes away with a view of geometry refreshed by experience. Israel M. Gelfand, Tatiana Alekseyevskaya (Gelfand), 2020-02-22 This text is the fifth and final in the series of educational books written by Israel Gelfand with his colleagues for high school students. These books cover the basics of mathematics in a clear and simple format the style Gelfand was known for internationally. Gelfand prepared these materials so as to be suitable for independent studies thus allowing students to learn and practice the material at their own pace without a class. Geometry takes a different approach to presenting basic geometry for high school students and others new to the subject. Rather than following the traditional axiomatic method that emphasizes formulae and logical deduction it focuses on geometric constructions. Illustrations and problems are abundant throughout and readers are encouraged to draw figures and move them in the plane allowing them to develop and enhance their geometrical vision imagination and creativity. Chapters are

structured so that only certain operations and the instruments to perform these operations are available for drawing objects and figures on the plane This structure corresponds to presenting sequentially projective affine symplectic and Euclidean geometries all the while ensuring students have the necessary tools to follow along Geometry is suitable for a large audience which includes not only high school geometry students but also teachers and anyone else interested in improving their geometrical vision and intuition skills useful in many professions Similarly experienced mathematicians can appreciate the book's unique way of presenting plane geometry in a simple form while adhering to its depth and rigor Gelfand was a great mathematician and also a great teacher The book provides an atypical view of geometry Gelfand gets to the intuitive core of geometry to the phenomena of shapes and how they move in the plane leading us to a better understanding of what coordinate geometry and axiomatic geometry seek to describe Mark Saul PhD Executive Director Julia Robinson Mathematics Festival The subject matter is presented as intuitive interesting and fun No previous knowledge of the subject is required Starting from the simplest concepts and by inculcating in the reader the use of visualization skills and after reading the explanations and working through the examples you will be able to confidently tackle the interesting problems posed I highly recommend the book to any person interested in this fascinating branch of mathematics Ricardo Gorin a student of the Extended Gelfand Correspondence Program in Mathematics EGCPM

*Intelligent Learning Environments: The Case of Geometry* Jean-Marie Laborde, 2012-12-06 This book is a thoroughly revised result updated to mid 1995 of the NATO Advanced Research Workshop on Intelligent Learning Environments the case of geometry held in Grenoble France November 13 16 1989 The main aim of the workshop was to foster exchanges

among researchers who were concerned with the design of intelligent learning environments for geometry. The problem of student modelling was chosen as a central theme of the workshop insofar as geometry cannot be reduced to procedural knowledge and because the significance of its complexity makes it of interest for intelligent tutoring system ITS development. The workshop centred around the following themes: modelling the knowledge domain, modelling student knowledge, design of didactic interaction and learner control. This book contains revised versions of the papers presented at the workshop. All of the chapters that follow have been written by participants at the workshop. Each formed the basis for a scheduled presentation and discussion. Many are suggestive of research directions that will be carried out in the future. There are four main issues running through the papers presented in this book: knowledge about geometry is not knowledge about the real world and materialization of geometrical objects implies a reification of geometry which is amplified in the case of its implementation in a computer since objects can be manipulated directly and relations are the results of actions. Laborde, Schumann. This aspect is well exemplified by research projects focusing on the design of geometric microworlds. Guin, Laborde.

**Creating Scientific Concepts** Nancy J. Nersessian, 2010-08-13. An account that analyzes the dynamic reasoning processes implicated in a fundamental problem of creativity in science: how does genuine novelty emerge from existing representations? How do novel scientific concepts arise? In *Creating Scientific Concepts*, Nancy Nersessian seeks to answer this central but virtually unasked question in the problem of conceptual change. She argues that the popular image of novel concepts and profound insight bursting forth in a blinding flash of inspiration is mistaken. Instead, novel concepts are shown to arise out of the interplay of three factors: an attempt to solve specific problems, the use of conceptual, analytical and material resources provided by the cognitive, social, cultural context of the problem, and dynamic processes of reasoning that extend ordinary cognition. Focusing on the third factor, Nersessian draws on cognitive science research and historical accounts of scientific practices to show how scientific and ordinary cognition lie on a continuum and how problem-solving practices in one illuminate practices in the other. Her investigations of scientific practices show conceptual change as deriving from the use of analogies, imagistic representations and thought experiments integrated with experimental investigations and mathematical analyses. She presents a view of constructed models as hybrid objects serving as intermediaries between targets and analogical sources in bootstrapping processes. Extending these results, she argues that these complex cognitive operations

and structures are not mere aids to discovery but that together they constitute a powerful form of reasoning model based reasoning that generates novelty This new approach to mental modeling and analogy together with Nersessian's cognitive historical approach make *Creating Scientific Concepts* equally valuable to cognitive science and philosophy of science

*Alfred Tarski* Andrew McFarland, Joanna McFarland, James T. Smith, 2014-08-11 Alfred Tarski 1901-1983 was a renowned Polish American mathematician a giant of the twentieth century who helped establish the foundations of geometry set theory model theory algebraic logic and universal algebra Throughout his career he taught mathematics and logic at universities and sometimes in secondary schools Many of his writings before 1939 were in Polish and remained inaccessible to most mathematicians and historians until now This self-contained book focuses on Tarski's early contributions to geometry and mathematics education including the famous Banach-Tarski paradoxical decomposition of a sphere as well as high school mathematical topics and pedagogy These themes are significant since Tarski's later research on geometry and its foundations stemmed in part from his early employment as a high school mathematics teacher and teacher trainer The book contains careful translations and much newly uncovered social background of these works written during Tarski's years in Poland *Alfred Tarski Early Work in Poland* serves the mathematical educational philosophical and historical communities by publishing Tarski's early writings in a broadly accessible form providing background from archival work in Poland and updating Tarski's bibliography A list of errata can be found on the author Smith's personal webpage
