Hormonal Regulation of Development
 I J. MacMillan, 2012-12-06 This is the first of the set of three volumes in the Encyclopedia of Plant Physiology New Series that will cover the area of the hormonal regulation of plant growth and development The overall plan for the set assumes that this area of plant physiology is sufficiently mature for a review of current knowledge to be organized in terms of unifying principles and processes Reviews in the past have generally treated each class of hormone individually but this set of volumes is subdivided according to the properties common to all classes Such an organization permits the examination of the hypothesis that differing classes of hormones acting according to common principles are determinants of processes and phases in plant development Also in keeping with this theme a plant hormone is defined as a compound with the properties held in common by the native members of the recognized classes of hormone Current knowledge of the hormonal regulation of plant development is grouped so that the three volumes consider advancing levels of organizational complexity viz molecular and subcellular cells tissues organs and the plant as an organized whole and the plant in relation to its environment The present volume treats the molecular and subcellular aspects of hormones and the processes they regulate Although it deals with chemically distinct classes of hormone this volume stresses properties and modes of studying them that are common to all classes

Hormonal regulation of immune responses Georgia Papapavlou Lingehed, 2024-11-04

Multiple sclerosis MS is a chronic autoimmune inflammatory disease of the central nervous system driven by immune dysregulation. Despite significant advancements in treatment options, many patients continue to deteriorate, thus a deeper understanding of the underlying mechanisms that drive MS is crucial for identifying novel biomarkers and therapeutic strategies. Interestingly, disease symptoms improve transiently during pregnancy, with the most pronounced effects occurring in the third trimester. This improvement is followed by a postpartum exacerbation before disease activity returns to pre-pregnancy levels. Although the precise mechanisms behind this pregnancy-induced modulation remain unclear, immune and hormonal adaptations during pregnancy, which help prevent rejection of the semi-foreign fetus, likely play a central role. The aim of this thesis was to use the pregnancy-induced modulation of MS as a basis to gain a deeper understanding of the mechanisms that both promote and alleviate the disease and to identify factors contributing to these processes. Initially, the effects of pregnancy hormones and synthetic hormones, progestins, on the immune system were investigated, with a focus on CD4 T cells, which play a crucial role in both immunity and MS pathogenesis. Additionally, immune-related changes in MS patients and healthy controls during pregnancy and postpartum were examined to better understand the dynamics of immune modulation in MS. Progesterone (P4) and estradiol (E2) are key pregnancy hormones that regulate immune responses. Their levels exhibit an inverse relationship to MS activity, peaking during the third trimester when disease activity is lowest and dropping sharply postpartum, coinciding with symptom exacerbation. In paper I, we examined the *in vitro* effects of P4 and E2 on CD4 T cell activation from healthy female donors. The results showed that P4, particularly at placenta-relevant concentrations, downregulated T cell activation, as indicated by a reduced proportion of activated cells and decreased secretion of proteins involved in immune and metabolic pathways. In contrast, E2 was found to enhance T cell activation. Building on these findings, paper II explored the immunomodulatory effects of various progestins, synthetic progesterone analogs, on CD4 T cell activation, comparing their effects to those of P4. Several progestins that were able to dampen T cell activation were identified, including medroxyprogesterone acetate (MPA), cyproterone acetate (CPA), norgestrel (NES), and dienogest (DNG). Transcriptomic profiling revealed that progestins reversed activation-induced gene expression changes affecting immune-related pathways. Notably, the progestin-modulated genes significantly overlapped with genes associated with MS and rheumatoid arthritis, both of which improve during pregnancy. Furthermore, there was a significant overlap of commonly regulated genes among the progestins, suggesting shared mechanisms of action. Following this, we investigated the effects of pregnancy on MS patients. To this end, samples from MS patients and healthy controls collected during pregnancy and postpartum were analyzed. In paper III, plasma protein profiling revealed gradual dynamic changes in protein expression, with similar patterns observed in both groups. These changes were most prominent in the third trimester and reverted postpartum, closely mirroring the clinical course of MS. Notably, several anti-inflammatory proteins were upregulated during pregnancy, while pro-inflammatory proteins were downregulated. In paper IV, these findings were further expanded by

investigating transcriptomic and epigenetic changes in peripheral T cells CD4 and CD8 during pregnancy in both MS patients and healthy controls Similar to the previous study we observed prominent regulation in both gene expression and DNA methylation with changes peaking in the third trimester and reverting postpartum reflecting disease activity and broadly overlapping in both groups Many of the key genes and pathways involved in this pregnancy induced regulation are central in T cell function and had been previously associated with MS Overall the findings presented in this thesis offer valuable insights into the immunomodulatory effects of pregnancy on MS identifying key proteins genes and pathways that are dynamically regulated during this period Additionally P4 and its synthetic analogs progestins emerge as central players in decreasing T cell responses with P4 suggested to play a significant role in pregnancy induced immune modulation While these results underscore the potential of P4 and progestins as therapeutic agents for MS further research is needed to elucidate their mechanisms and assess their long term therapeutic potential

Hormone Action in Plant Development — A Critical Appraisal G. V. Hoad,J. R. Lenton,M. B. Jackson,2013-10-22 Hormone Action in Plant Development A Critical Appraisal documents the proceedings of the Tenth Long Ashton Symposium September 1986 The symposium was convened to assess the evidence for and against the view that plant hormones are endogenous regulators of plant development The meeting also aimed to focus on and assess promising strategies for future research The symposium opened with the Douglas Wills Lecture given by Professor Carl Leopold In many respects progress in research on animal hormones seems greater than in the plant sciences and there may well be merit in following progress in animal hormone research as suggested by Professor Leopold The symposium was comprised of four sessions The introductory session considered the coordinating role of hormones in plant growth and development and focused on hormone action at the molecular level including their binding to receptors and their control of gene expression The next two sessions embraced contributions on the experimental manipulation of development by genetic notably by biochemical mutants chemical for example with gibberellin biosynthesis inhibitors and environmental including drought stress means All these approaches consolidated the central importance of hormones in plant growth In the final session three speakers suggested some promising avenues for future research into the physiology biochemistry and molecular biology of plant hormones
