

In this practical book, you will find the essential features that need to be taken into consideration during gestation, calving and the postpartum period in order to deal with calving successfully.

3 Physiology of calving: normal delivery

Stages of normal delivery

Calving takes place in three well-defined stages:

1. Distension stage
2. Partial expulsive stage
3. Effortful expulsive stage

Stage	Duration	Signs	Comments
Distension	6-10 hours	Mucus, mellowing, redness to skin. Usually, the fetal membranes can be seen in the vulva.	Gradually becomes positioned in the pelvic canal.
Partial expulsion	Usually 1-2 hours (Rare: 30 mins or more)	Abdominal contractions that increase in frequency, intensity, regularity, rupture of the foetal membranes and rupture of the foetal skin.	Foetus being pushed canal.
Effortful expulsion	Within 10-15 postpartum	Expulsion of the placenta.	Post-partum

1. Distension stage

Distension stage of calving. The vulva is swollen and the foetal membranes are visible in the vulva.

- Cervix progressively dilates until approximately the size of a fist.
- The position of the cervix is up and 10-15 hours before the foetus is born.
- Characterised by a specific foaming, mellowing, animal is restless, redness to skin, redness to vulva.
- Repeated series of abdominal contractions of 10-15 minutes.
- During contractions, which are slow, the cervix dilates.
- When the cervix is sufficiently dilated, the foetus can pass through it and the calf will be pushed into the pelvic canal.

2. Partial expulsive stage

- Abdominal contractions start as the calf's head passes down the canal.
- Contractions become more frequent (every 2-3 minutes), last longer and increase in intensity.
- Foetus is pushed, especially foetus, down to the pelvic canal.
- Increased in pressure causes the rupture of the foetal membranes. The "foetus is born".

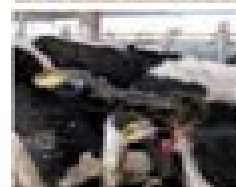

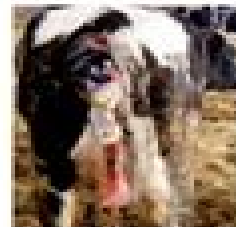

3 Physiology of calving: normal delivery

Presentations

Definitions

- **Presentation** indicates the relation between the long axis of the foetus and the plane which cervix passes through the vulva.
- **Position** indicates which surface of the foetus is in contact with the cervix (back, dorsal, ventral or head).
- **Pelvic axis** indicates the position of the foetus with head, in extension or flexion.

In a normal spontaneous delivery, two presentations are possible:

Extension

This is the most common position of the calf.

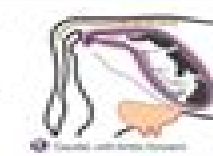

- **Normal presentation:** 1 is born "head first".
- **Extension:** the foetus is born with its head first, but its body is extended towards the cervix.
- **Flexion:** the foetus is born with its head first, but its body is flexed towards the cervix.

Flexion

Although this is considered a normal position, it is less frequent and usually requires a longer delivery, and may increase the mortality of the calf.

- **Flexion:** the foetus is born with its head first, but its body is flexed towards the cervix.
- **Extension:** the foetus is born with its head first, but its body is extended towards the cervix.
