Fixed Point Theory In Distance Spaces:

Fixed Point Theory in Distance Spaces William Kirk, Naseer Shahzad, 2014-10-23 This is a monograph on fixed point theory covering the purely metric aspects of the theory particularly results that do not depend on any algebraic structure of the underlying space Traditionally a large body of metric fixed point theory has been couched in a functional analytic framework This aspect of the theory has been written about extensively There are four classical fixed point theorems against which metric extensions are usually checked These are respectively the Banach contraction mapping principal Nadler's well known set valued extension of that theorem the extension of Banach's theorem to nonexpansive mappings and Caristi's theorem These comparisons form a significant component of this book This book is divided into three parts Part I contains some aspects of the purely metric theory especially Caristi's theorem and a few of its many extensions There is also a discussion of nonexpansive mappings viewed in the context of logical foundations Part I also contains certain results in hyperconvex metric spaces and ultrametric spaces Part II treats fixed point theory in classes of spaces which in addition to having a metric structure also have geometric structure These specifically include the geodesic spaces length spaces and CAT 0 spaces Part III focuses on distance spaces that are not necessarily metric These include certain distance spaces which lie strictly between the class of semimetric spaces and the class of metric spaces in that they satisfy relaxed versions of the triangle inequality as well as other spaces whose distance properties do not fully satisfy the metric axioms Fixed Point Results in W-Distance Spaces Vladimir Rakočević, 2021-12-30 Fixed Point Results in W Distance Spaces is a self contained and comprehensive reference for advanced fixed point theory and can serve as a useful guide for related research The book can be used as a teaching resource for advanced courses on fixed point theory which is a modern and important field in mathematics It would be especially valuable for graduate and postgraduate courses and seminars Features Written in a concise and fluent style covers a broad range of topics and includes related topics from research Suitable for researchers and postgraduates Contains brand new results not published elsewhere

Metric Structures and Fixed Point Theory

Dhananjay Gopal, Praveen Agarwal, Poom Kumam, 2021-04-08 It is an indisputable argument that the formulation of metrics by Fréchet in the early 1900s opened a new subject in mathematics called non linear analysis after the appearance of Banach's fixed point theorem Because the underlying space of this theorem is a metric space the theory that developed following its publication is known as metric fixed point theory It is well known that metric fixed point theory provides essential tools for solving problems arising in various branches of mathematics and other sciences such as split feasibility problems variational inequality problems non linear optimization problems equilibrium problems selection and matching problems and problems of proving the existence of solutions of integral and differential equations are closely related to fixed point theory For this reason many people over the past seventy years have tried to generalize the definition of metric space and corresponding fixed point theory This trend still continues A few questions lying at the heart of the theory remain open and there are many

unanswered questions regarding the limits to which the theory may be extended Metric Structures and Fixed Point Theory provides an extensive understanding and the latest updates on the subject The book not only shows diversified aspects of popular generalizations of metric spaces such as symmetric b metric w distance G metric modular metric probabilistic metric fuzzy metric graphical metric and corresponding fixed point theory but also motivates work on existing open problems on the subject Each of the nine chapters contributed by various authors contains an Introduction section which summarizes the material needed to read the chapter independently of the others and contains the necessary background several examples and comprehensive literature to comprehend the concepts presented therein This is helpful for those who want to pursue their research career in metric fixed point theory and its related areas Features Explores the latest research and developments in fixed point theory on the most popular generalizations of metric spaces Description of various generalizations of metric spaces Very new topics on fixed point theory in graphical and modular metric spaces Enriched with examples and open problems This book serves as a reference for scientific investigators who need to analyze a simple and direct presentation of the fundamentals of the theory of metric fixed points It may also be used as a text book for postgraduate and research students who are trying to derive future research scope in this area *Fixed Point Theory and Graph Theory* Monther Alfuraidan, Qamrul Ansari, 2016-06-20 Fixed Point Theory and Graph Theory provides an intersection between the theories of fixed point theorems that give the conditions under which maps single or multivalued have solutions and graph theory which uses mathematical structures to illustrate the relationship between ordered pairs of objects in terms of their vertices and directed edges This edited reference work is perhaps the first to provide a link between the two theories describing not only their foundational aspects but also the most recent advances and the fascinating intersection of the domains The authors provide solution methods for fixed points in different settings with two chapters devoted to the solutions method for critically important non linear problems in engineering namely variational inequalities fixed point split feasibility and hierarchical variational inequality problems The last two chapters are devoted to integrating fixed point theory in spaces with the graph and the use of retractions in the fixed point theory for ordered sets Introduces both metric fixed point and graph theory in terms of their disparate foundations and common application environments Provides a unique integration of otherwise disparate domains that aids both students seeking to understand either area and researchers interested in establishing an integrated research approach Emphasizes solution methods for fixed points in non linear problems such as variational inequalities split feasibility and hierarchical variational inequality problems that is particularly appropriate for engineering and core science applications *Fixed Point Theory and Related Topics* Hsien-Chung Wu, 2020-03-13 Fixed point theory arose from the Banach contraction principle and has been studied for a long time Its application mostly relies on the existence of solutions to mathematical problems that are formulated from economics and engineering After the existence of the solutions is guaranteed the numerical methodology will be established to obtain

the approximated solution Fixed points of function depend heavily on the considered spaces that are defined using the intuitive axioms In particular variant metrics spaces are proposed like a partial metric space b metric space fuzzy metric space and probabilistic metric space etc Different spaces will result in different types of fixed point theorems In other words there are a lot of different types of fixed point theorems in the literature Therefore this Special Issue welcomes survey articles Articles that unify the different types of fixed point theorems are also very welcome The topics of this Special Issue include the following Fixed point theorems in metric space Fixed point theorems in fuzzy metric space Fixed point theorems in probabilistic metric space Fixed point theorems of set valued functions in various spaces The existence of solutions in game theory The existence of solutions for equilibrium problems The existence of solutions of differential equations The existence of solutions of integral equations Numerical methods for obtaining the approximated fixed points
