

Building Proteins from RNA Lab Report

The purpose of this lab was to explore the process of building proteins from the information carried by RNA. My question for the lab was how do mRNA and tRNA combine to form proteins? My prediction of the lab was that the RNA transcribed from the DNA would have the sequence for amino acids, and that tRNA would connect the extra amino acids to the mRNA to create proteins. The materials used in this lab were amino acids, mRNA, DNA, RNA, and tRNA. The procedure started with DNA, and it transcribed a template onto the mRNA. The mRNA then traveled to the ribosome in the cell, and then the mRNA started the translation process. To start the translation process, initiation begins. The mRNA binds to the ribosome, and then the tRNA binds to it as well. Then elongation happens. During elongation, the ribosome moves along the mRNA, reading the nucleotide sequence in sets of three called codons. Each codon corresponds to a certain amino acid. The tRNA then binds to the mRNA with the matching amino acids to the codons, and they form peptide bonds. Lastly, there is termination. The elongation process continues until a stop codon is reached on the mRNA. Stop codons signal the ribosome and tRNA to stop binding and end protein synthesis. Release factors then bind to the ribosome, releasing the new protein. Possible sources for errors were that the DNA had mutations, errors in transcription, and premature termination, but I did not experience any of those during the lab. During the lab, my prediction was proved right and my question was answered by seeing that mRNA codons and tRNA amino acids bind to make proteins in the ribosome of the cell.
