There is a growing interest in the use of ontologies for multi-agent system applications. On the one hand, the agent paradigm is successfully employed in those applications where autonomous, loosely coupled, heterogeneous and distributed systems need to interoperate in order to achieve a common goal. On the other hand, ontologies have established themselves as a powerful tool to enable knowledge sharing, and a growing number of applications have benefited from the use of ontologies as a means to achieve semantic interoperability among heterogeneous distributed systems. In principle, ontologies and agents are a match made in heaven that has failed to happen. What makes a simple piece of software an agent is its ability to communicate in a social environment, to make autonomous decisions, and to be proactive on behalf of

its user Communication ultimately depends on understanding the goals preferences and constraints posed by the user
Autonomy is the ability to perform a task with little or no user intervention while proactiveness involves acting autonomously with no need for user prompting Communication but also autonomy and proactiveness depend on knowledge The ability to communicate depends on understanding the syntax terms and structure and the semantics of a language Ontologies provide the terms used to describe a domain and the semantics associated with them In addition ontologies are often complemented by some logical rules that constrain the meaning assigned to the terms These constraints are represented by inference rules that can be used by agents to perform the reasoning on which autonomy and proactiveness are based Engine Performance Don Knowles, 1995 Classroom Manual Shop Manual completely cross referenced with theory in Classroom Manual and hands on in Shop Manual **Focus On: 100 Most Popular Compact Cars** Wikipedia contributors, Federal Register ,1993-10 *1999 Manual Changes* ,1999 **Public Health Reports** ,1992
