Harold Thimbleby,Brid O'Conaill,Peter J. Thomas,2013-03-14 Most organisations try to protect their systems from unauthorised access usually through passwords Considerable resources are spent designing secure authentication mechanisms but the number of security breaches and problems is still increasing DeAlvare 1990 Gordon 1995 Hitchings 1995 Unauthorised access to systems and resulting theft of information or misuse of the system is usually due to hackers cracking user passwords or obtaining them through social engineering System security unlike other fields of system development has to date been regarded as an entirely technical issue little research has been done on usability or human factors related to use of

security mechanisms Hitchings 1995 concludes that this narrow perspective has produced security mechanisms which are much less effective than they are generally thought to be Davis Price 1987 point out that since security is designed implemented used and breached by people human factors should be considered in the design of security mechanism It seems that currently hackers pay more attention to human factors than security designers do The technique of social engineering for instance obtaining passwords by deception and persuasion exploits users lack of security awareness Hitchings 1995 also suggests that organisational factors ought to be considered when assessing security systems The aim of the study described in this paper was to identify usability and organisational factors which affect the use of passwords The following section provides a brief overview of authentication systems along with usability and organisational issues which have been identified to date 1

The Electronic Design Automation Handbook Dirk Jansen, 2010-02-23 When I attended college we studied vacuum tubes in our junior year At that time an average radio had vacuum tubes and better ones even seven Then transistors appeared in 1960s A good radio was judged to be one with more than ten transistors Later good radios had 15 20 transistors and after that everyone stopped counting transistors Today modern processors running personal computers have over 10 million transistors and more millions will be added every year The difference between 20 and 20M is in complexity methodology and business models Designs with 20 transistors are easily generated by design engineers without any tools whilst designs with 20M transistors can not be done by humans in reasonable time without the help of Prof Dr Gajski demonstrates the Y chart automation This difference in complexity introduced a paradigm shift which required sophisticated methods and tools and introduced design automation into design practice By the decomposition of the design process into many tasks and abstraction levels the methodology of designing chips or systems has also evolved Similarly the business model has changed from vertical integration in which one company did all the tasks from product specification to manufacturing to globally distributed client server production in which most of the design and manufacturing tasks are outsourced
