

PRE-LAB QUESTIONS

1. List the functions of the skeletal system.
 - a. *The function of the skeletal system is to protect and support the body, it supports and allows movement, produces new blood cells and stores nutrients for the body*
2. What material contributes the most to the compressive strength of bone?
 - a. *The material that contributes the most to the compressive strength of the bone is calcium carbonate*
3. Briefly describe the process of bone remodeling.
 - a. *Bone remodeling is a continuous process to replace old bone with new bone. The stages of remodeling involve living cells, osteoblasts, and osteoclasts. The stages are resting stage, bone resorption, transition, and bone formation. This cycle continues for the span of an organism life.*
4. Research Wolff's Law. How does the formation of torus mandibularis relate to this theory?
 - a. *Wolff's law states that bones adapt based on needs/stress/demands. An evolved/remodeled bone shows there was stress, or force on that bone requiring a change in structure. The formation of the torus mandibularis relates to Wolff's law, because this a bone reaction/adaption to some type of pressure or stress. Research shows this may be related to grinding of the teeth.*
5. Given your understanding of Wolff's Law, what mechanical consideration would be important when designing a bioreactor for osteocyte growth ex vivo?
 - a. *Considering Wolff's law, when designing a bioreactor for osteocyte growth ex vivo, it would be important to design the bioreactor so that you could determine adaptations that are created by stress/demands. It would also be important to ensure the bioreactor did not put any unwarranted stress/pressure on the osteocyte to encourage adoptions*
