**Foundations of Global Genetic Optimization** Robert Schaefer, 2007-07-07 Genetic algorithms today constitute a family of effective global optimization methods used to solve difficult real life problems which arise in science and technology Despite their computational complexity they have the ability to explore huge data sets and allow us to study exceptionally problematic cases in which the objective functions are irregular and multimodal and where information about the extrema location is unobtainable in other ways They belong to the class of iterative stochastic optimization strategies that during each step produce and evaluate the set of admissible points from the search domain called the random sample or population As opposed to the Monte Carlo strategies in which the population is sampled according to the uniform probability distribution over the search domain genetic algorithms modify the probability distribution at each step Mechanisms which adopt sampling probability distribution are transposed from biology They are based mainly on genetic code mutation and crossover as well as on selection among living individuals Such mechanisms have been tested by solving multimodal problems in nature which is confirmed in part by the many species of animals and plants that are well fitted to different ecological niches They direct the search process making it more effective than a completely random one search with a uniform sampling distribution Moreover well tuned genetic

based operations do not decrease the exploration ability of the whole admissible set which is vital in the global optimization process. The features described above allow us to regard genetic algorithms as a new class of artificial intelligence methods which introduce heuristics well tested in other fields to the classical scheme of stochastic global search.

Handbook of Markov Decision Processes Eugene A. Feinberg, Adam Shwartz, 2012-12-06 Eugene A Feinberg Adam Shwartz This volume deals with the theory of Markov Decision Processes (MDPs) and their applications. Each chapter was written by a leading expert in the respective area. The papers cover major research areas and methodologies and discuss open questions and future research directions. The papers can be read independently with the basic notation and concepts of Section 1.2. Most chapters should be accessible by graduate or advanced undergraduate students in fields of operations research, electrical engineering and computer science.

1.1 AN OVERVIEW OF MARKOV DECISION PROCESSES The theory of Markov Decision Processes also known under several other names including sequential stochastic optimization, discrete time stochastic control and stochastic dynamic programming studies sequential optimization of discrete time stochastic systems. The basic object is a discrete time stochastic system whose transition mechanism can be controlled over time. Each control policy defines the stochastic process and values of objective functions associated with this process. The goal is to select a good control policy. In real life decisions that humans and computers make on all levels usually have two types of impacts: i) they cost or save time, money or other resources or they bring revenues as well as ii) they have an impact on the future by influencing the dynamics. In many situations decisions with the largest immediate profit may not be good in view of future events. MDPs model this paradigm and provide results on the structure and existence of good policies and on methods for their calculation.
