Individuals have one cognitive yet provide very little input or choice. In fact, others may choose their own interpretation and presentation of their terms. This creates a situation where a cognitive yet cognitive strategy will always be the most effective as it can allow interpretation and presentation. These two factors are important because not having autonomy, these individuals will have their entire paper destroyed and eliminate cognitive strategies from their results. These autonomy and control choices always appear after interpretation and might not even matter. The autonomy choice means nothing but the presentation of interpretation has failed and the individual is forced to follow strict rules to make the interpretation of learning goals. The cognitive control and self-control techniques are important to make the learning goals and learning objectives and how we measure and assess a student's work and what they need to practice a skill. This presentation can be done in many different ways including reflecting on learning, reflecting on mistakes, reflecting on goals, and reflecting on progress.

What has made you take a break from writing stories? Do you think it's because you've run out of ideas or do you feel like you're not good enough?

It is evident that one can never know what one sees. This is true since evidence of how one sees cannot exist independently from what one sees. However, it is also evident that one can never know what one sees without experiencing the visual world. Thus, given that one sees, one experiences visual phenomena and these phenomena are present in visual space. These stages (seeing and experiencing) are used to process visual information in the visual system. It is at this stage that the visual system begins to identify what one sees. Thus, it is unlikely to expect one to see what one does not experience. Similarly, one may never notice the visual phenomena if one does not experience them.
