Technical Assessment of Maglev System Concepts, 1998 The Government Maglev System Assessment Team operated from 1991 to 1993 as part of the National Maglev Initiative They assessed the technical viability of four U S Maglev system concepts using the French TGV high speed train and the German TR07 Maglev system as assessment baselines Maglev in general offers advantages that include high speed potential excellent system control high capacity low energy consumption low maintenance modest land requirements low operating costs and ability to meet a variety of transportation missions Further the U S Maglev concepts could provide superior performance to TR07 for similar cost or similar performance for less cost They also could achieve both lower trip times and lower energy consumption along typical U S routes These advantages result generally from the use of large gap magnetic suspensions more powerful linear synchronous motors and tilting vehicles Innovative concepts for motors guideways suspension and superconducting magnets all contribute to a potential for superior long term performance of U S Maglev systems compared with TGV and TR07 **Automobile Collision Data; an Assessment of Needs and Methods of Acquisition** United States. Automated guideway transit : an assessment of PRT and other new systems, including supporting panel reports :
prepared at the request of the Senate Committee on Appropriations, Transportation Subcommittee , **Assessment of Costs and Benefits of Flexible and Alternative Fuel Use in the U.S. Transportation Sector: The international experience**, 1988 **Dynamic and Fatigue Assessment of Heavy-Duty Engine Valves** Angelina Eret, 2024-01-01 This book provides findings on the simulation of the valve dynamic to the current technological standards Above all it delivers a simulation based and predictive approach on the fatigue strength assessment of four stroke heavy duty engine valves The demand for more efficient combustion engines with fuel flexibility goes along with increasing component requirements regarding strength and durability while the development costs should remain low In this context the present book focuses on the gas exchange valves of heavy duty engines Especially the valves on the exhaust side have an increased risk of fatigue failure The aim of this book is the generation of a predictive fatigue strength assessment to strengthen the frontloading of the exhaust valve design process and to increase the reliability of the component In the context of fatigue assessment this book examines the loads of the exhaust valve during its working cycle Beside the high temperature and cylinder pressure further loads act on the exhaust valve like actuation force or an eccentric impact of the valve on the valve seat ring Furthermore a bold valve secondary dynamic in the form of valve bending vibrations is observed on the exhaust valves of heavy duty engines increasing the valve load even more The cause of this secondary dynamic is unknown This book investigates the valve loads to get the necessary input for the fatigue strength assessment With respect to a predictive approach the determination of valve dynamic and valve loads is based on a multibody simulation model of the valve train In

order to deliver predictive results and a transferable method this simulation model includes all relevant physical effects to describe the valve dynamic accurately during all valve load phases of the working cycle With the simulation model the root cause for the bold valve secondary dynamic is examined iteratively The model delivers not only the cause for the valve secondary dynamic but most importantly the critical valve loads These loads deliver the input for the fatigue strength assessment To ensure the robustness of the load data determined by the simulation model the sensitivity of influences on the valve load is examined In this context geometrical misalignment fluctuations in load data and variable engine operation points are considered A load collective based on the variation of influences on the valve load is the result of this analysis All the results of the influence and sensitivity study are generated with the newly developed simulation model of the valve train Moreover this book outlines measurements on a testbed engine In scope of these measurements are temperature and strain measurements of the valve The generated data validate the simulation model of the valve train Additionally the statistical evaluation of the data is used in the subsequent fatigue strength assessment to increase the reliability of the results
