**Regulatory RNAs in the Nervous System, 2nd Edition** Tommaso Pizzorusso, Alessandro Cellerino, Laure Bally-Cuif, 2018-11-13

Until about a decade ago the non coding part of the genome was considered without function RNA sequencing studies have shown however that a considerable part of the non coding genome is transcribed and that these non coding RNAs nc RNAs can regulate gene expression Almost on weekly basis new findings reveal the regulatory role of nc RNAs exert in many biological processes Overall these studies are making increasingly clear that both in model organisms and in humans complexity is not a function of the number of protein coding genes but results from the possibility of using combinations of genetic programs and controlling their spatial and temporal regulation during development senescence and in disease by regulatory RNAs This has generated a novel picture of gene regulatory networks where regulatory nc RNAs represent novel layers of regulation Particularly well characterized is the role of microRNAs miRNAs small nc RNAs that bind to mRNAs and regulate gene expression after transcritpion This message is particularly clear in the nervous system where miRNAs have been involved in regulating cellular pathways controlling fundamental functions during development synaptic plasticity and in neurodegenerative disease It has also been shown that neuronal miRNAs are tightly regulated by electrical activity at the level of transcription biogenesis stability and specifically targeted to dendrites and synapses Deregulation of expression of

miRNAs is proposed not only as potential disease biomarker but it has been implicated directly in the pathogenesis of complex neurodegenerative disease. This so called RNA revolution also led to the exploitation of RNA interference and the development of related tools as potential treatment of a vast array of CNS disease that could benefit from regulation of disease associated genes. In spite of these advancements the relatively young age of this field together with the inherent high molecular complexity of RNA regulation of biological processes have somewhat hindered its communication to the whole of the neuroscience community. This Research Topic aims at improving this aspect by putting around the same virtual table scientists covering aspects ranging from basic molecular mechanisms of regulatory RNAs in the nervous system to the analysis of the role of specific regulatory RNAs in neurobiological processes of development plasticity and aging. Furthermore we included papers analyzing the role of regulatory RNAs in disease models from neuromuscular to higher cognitive functions and more technically oriented papers dealing with new methodologies to study regulatory RNA biology and its translational potential.

*Primary and Stem Cells* Uma Lakshmipathy, Bhaskar Thyagarajan, 2011-10-31. This book describes basic cell engineering methods emphasizing stem cell applications and use of the genetically modified stem cells in cell therapy and drug discovery. Together the chapters introduce and offer insights on new techniques for engineering of stem cells and the delivery of transgenes into stem cells via various viral and non viral systems. The book offers a guide to the types of manipulations currently available to create genetically engineered stem cells that suit any investigator's purpose whether it's basic science investigation, creation of disease models and screens or cells for therapeutic applications.

Development of Circadian Clock Functions, volume II Daisuke Ono, Takahiro J. Nakamura, Jeff Jones, Jihwan Myung, Rae Silver, 2024-07-31. The temporal order of physiological functions such as sleep wakefulness is regulated by the circadian clock. This intrinsic clock starts ticking in the embryo and matures during development with attenuation of the clock function in the elderly illustrated by attenuation of synchrony entrainment and outputs of cellular circadian rhythms in the SCN. This age related diminution can contribute to the emergence of diseases such as sleep disorders, infertility, diabetes, mental disorders etc. Over the course of our lives a variety of internal and external factors are under the influence of the circadian clock. This inherent developmental plasticity of the circadian system is critical for the establishment of normal bodily functions to adapt to the changing environment on earth. In mammals the central circadian clock is located in the suprachiasmatic nucleus (SCN) of the hypothalamus. Circadian rhythms in the SCN are observed during the embryonic period and input and output pathways from the SCN are formed after birth. During postnatal development functions of neurotransmitters in the SCN are changed which have an influence on special temporal patterns of circadian rhythms in the SCN and outputs signals to the outside of the SCN. During postnatal development properties of circadian rhythms in the SCN and its inputs and outputs can be modulated by environmental light conditions. Recent optical manipulation and imaging techniques have revealed that cell type specific functions for circadian rhythms. However it remains unclear which cell types or networks in the brain are modulated during

postnatal development and how these cells regulate circadian rhythms depending on postnatal period      **Improvement for Quality and Safety Traits in Horticultural Plants** Pei Xu,Xinchao Wang,Ferdinando Branca,2022-06-23      *Plant Adaptations to Phosphate Deficiency* Alex Joseph Valentine,Alejandra Zúñiga-Feest,Aleysis Kleinert,Pablo Cornejo,Vagner A. Benedito,2021-05-18 Phosphate is an essential mineral to all plants and its availability in soils is an increasing challenge for agriculture Phosphate is abundant in soils but its biological availability is often low due to the complexes that it forms with soil minerals and compounds The biological availability of Phosphate is further reduced in acidic soils which represent approximately 40% of earth's arable agricultural lands Agricultural systems compensate Phosphate deficiency with fertilizers coming from the mining of rock phosphate which is estimated to exhaust within the next 50 years For these reasons Phosphate limitations in natural and agricultural ecosystems is going to become a global problem and we urgently need to better understand how plants respond to Phosphate deficiency      Jasmonic Acid Pathway in Plants Kenji Gomi,2020-04-30 The plant hormone jasmonic acid JA and its derivative an amino acid conjugate of JA jasmonoyl isoleucine JA Ile are signaling compounds involved in the regulation of defense and development in plants The number of articles studying on JA has dramatically increased since the 1990s JA is recognized as a stress hormone that regulates the plant response to biotic stresses such as herbivore and pathogen attacks as well as abiotic stresses such as wounding and ultraviolet radiation Recent studies have remarkably progressed the understanding of the importance of JA in the life cycle of plants JA is directly involved in many physiological processes including stamen growth senescence and root growth JA regulates production of various metabolites such as phytoalexins and terpenoids Many regulatory proteins involved in JA signaling have been identified by screening for Arabidopsis mutants However much more remains to be learned about JA signaling in other plant species This Special Issue Jasmonic Acid Pathway in Plants contains 5 review and 15 research articles published by field experts These articles will help with understanding the crucial roles of JA in its response to the several environmental stresses and development in plants      **Beta-Catenin and Ha-ras - Master Regulators of Zonal Gene Expression in Mouse Liver?** Albert Braeuning,2008 Hepatocytes located in the periportal or perivenous regions of the liver lobule have different often complementary functions as indicated by differences in the content and activity of various enzymes of the intermediary and xenobiotic metabolism The signaling molecules mediating this metabolic zonation however are largely unknown Based on the correlation of marker protein expression between perivenous hepatocytes and Ctnnb1 encoding beta catenin mutated mouse hepatomas and between periportal hepatocytes and Ha ras mutated hepatomas a hypothesis was developed postulating that two opposing signals a Wnt signal maybe delivered by endothelial cells of the central veins activating a beta catenin dependent pathway and a second signal delivered by blood borne molecules activating Ras dependent downstream cascades regulate gene expression in hepatocytes from the periportal and perivenous domains of the liver lobule The impact of beta catenin and Ras signaling on zonal gene expression was analyzed in vivo by use of different

transgenic mouse strains Zone specific physiological activation and antagonism of the two pathways were demonstrated Transcriptome profiles of Ctnnb1 and Ha ras mutated tumors closely resembled those of perivenous and periportal hepatocytes In vitro experiments with primary hepatocytes and hepatoma cells confirmed the role of beta catenin signaling in the induction of perivenous gene expression particularly of drug metabolizing enzymes Inducibility of drug metabolizing enzymes by xenobiotics was demonstrated to be modulated by beta catenin in vitro and in vivo beta catenin thereby activated transcription by both direct beta catenin TCF dependent and indirect mechanisms Serum components were shown to inhibit beta catenin mediated transcription and to induce the expression of periportal markers Serum mediated inhibition of beta catenin signaling was not exclusively linked to Ras activation but also to the action of different ligand activated nuclear receptors thus suggesting a complex interplay of different blood borne molecules in the periportal repression of beta catenin signaling In summary the results favor the hypothesis that gene expression patterns in periportal and perivenous hepatocytes are regulated at least in part by Ras and beta catenin dependent signaling pathways In the perivenous areas of the liver lobule beta catenin seems to act as a master regulator of both basal and inducible expression of enzymes involved in the metabolism of drugs and xenobiotics

**Physiological Responses and Molecular Mechanisms** Weiwei Zhang,Xiaomeng Liu,Feng Xu,Moonhyuk Kwon,2025-08-07

Plant specialized metabolites are small molecules or organic compounds such as flavonoids quinones terpenoids alkaloids and phenolic compounds produced by plants They play a role in plant adaptation to the environment such as defending against predators and pests helping with pollination and providing protection against UV damage Some specialized metabolites also have certain physiological activities and pharmacological effects which are of great significance for the prevention and treatment of human tumors aging and cardiovascular diseases The distribution of specialized metabolites in plants is usually unique to species organs tissues and growth stages which leads to complex and diverse biosynthetic pathways of specialized metabolites The synthesis of plant specialized metabolites is controlled by genetic material and regulated by a variety of biotic and abiotic factors in the environment
