Albert A Gayle

Geometry Chapter 13 Form 2d:

Analytical Geometry 2D and 3D Vittal,2013 Designed to meet the requirements of UG students the book deals with the theoretical as well as the practical aspects of the subject Equal emphasis has been given to both 2D as well as 3D geometry The book follows a systematic approach with adequate examples for better understanding of the concepts **Linguistic**

Geometry Boris Stilman,2000-04-30 Linguistic Geometry From Search to Construction is the first book of its kind Linguistic Geometry LG is an approach to the construction of mathematical models for large scale multi agent systems A number of such systems including air space combat robotic manufacturing software re engineering and Internet cyberwar can be modeled as abstract board games These are games with moves that can be represented by the movement of abstract pieces over locations on an abstract board The purpose of LG is to provide strategies to guide the games participants to their goals Traditionally discovering such strategies required searches in giant game trees These searches are often beyond the capacity of modern and even conceivable future computers LG dramatically reduces the size of the search trees making the problems computationally tractable LG provides a formalization and abstraction of search heuristics used by advanced experts including chess grandmasters Essentially these heuristics replace search with the construction of strategies To formalize the heuristics LG employs the theory of formal languages i e formal linguistics as well as certain geometric structures over an abstract board The new formal strategies solve problems from different domains far beyond the areas envisioned by the experts For a number of these domains Linguistic Geometry yields optimal solutions **The Geometry of Biological Time**

Arthur T. Winfree,2013-03-09 Geometry of Biological Time deals with dynamics of processes that repeat themselves regularly Such rhythmic return through a cycle of change is an ubiquitous principle of organization in living systems In this revised and updated edition the author plans to extend the thread from 1980 to the present concentrating on areas which he personally feels have been interesting and where he feels there will be much activity in the future This involves going through spatial biochemical electrophysiological and organismic dynamical systems and patterns that were discovered by pursuing the theme of phase singularities that the original book introduced In particular the work on excitability in cell membranes has been thoroughly updated as have the references throughout the book **Theory Of Single And Multiple**

Interfaces: The Method Of Surface Green Function Matching F Garcia-moliner,Victor R Velasco,1992-06-08 Based on a scattering theoretic approach which effectively constitutes an extension of the Dyson or Lippman Schwinger theories Green functions constitute the backbone of a matching analysis This analysis is applied to a wide range of models materials and physical problems from electronic structure of semiconductor superlattices or phonons in metal superlattices to surface Brillouin scattering piezoelectric surface waves or interface waves in viscoelastic fluids *Probing Non-Equilibrium*

Dynamics in Two-Dimensional Quantum Gases Cheng-An Chen,2022-10-11 This thesis explores the physics of non equilibrium quantum dynamics in homogeneous two dimensional 2D quantum gases Ultracold quantum gases driven out of equilibrium

have been prominent platforms for studying quantum many body physics However probing non equilibrium dynamics in conventionally trapped inhomogeneous atomic quantum gases has been a challenging task because coexisting mass transport and spreading of quantum correlations often complicate experimental analyses In this work the author solves this technical hurdle by producing ultracold cesium atoms in a quasi 2D optical box potential The exquisite optical trap allows one to remove density inhomogeneity in a degenerate quantum gas and control its dimensionality The author also details the development of a high resolution in situ imaging technique to monitor the evolution of collective excitations and quantum transport down to atomic shot noise and at the length scale of elementary collective excitations Meanwhile tunable Feshbach resonances in ultracold cesium atoms permit precise and dynamical control of interactions with high temporal and even spatial resolutions By employing these state of the art techniques the author performed interaction quenches to control the generation and evolution of quasiparticles in quantum gases presenting the first direct measurement of quantum entanglement between interaction quench generated quasiparticle pairs in an atomic superfluid Quenching to attractive interactions this work shows stimulated emission of quasiparticles leading to amplified density waves and fragmentation forming 2D matter wave Townes solitons that were previously considered impossible to form in equilibrium due to their instability This thesis unveils a set of scale invariant and universal quench dynamics and provides unprecedented tools to explore quantum entanglement transport in a homogenous quantum gas
