Reproducible **Constructing Quantum Mechanics Volume Two** Michel Janssen, Anthony Duncan, 2023-08-17 This is the second of two volumes on the genesis of quantum mechanics in the first quarter of the 20th century It covers the period 1923 1927 After covering some of the difficulties the old quantum theory had run into by the early 1920s as well as the discovery of the exclusion principle and electron spin it traces the emergence of two forms of the new quantum mechanics matrix mechanics and wave mechanics in the years 1923 27 It then shows how the new theory took care of some of the failures of the old theory and put its successes on a more solid basis Finally it shows how in 1927 the two forms of the new theory were unified first through statistical transformation theory then through the Hilbert space formalism This volume provides a detailed analysis of the classic papers by Heisenberg Born Jordan Dirac De Broglie Einstein Schr dinger von Neumann and other authors Drawing on the correspondence of these and other physicists their later reminiscences and the extensive secondary literature on the quantum revolution this volume places these papers in the context of the discussions out of which modern quantum mechanics emerged It argues that the genesis of modern quantum mechanics can be seen as the construction of an arch on a scaffold provided by the old quantum theory discarded once the arch could support itself

Nanotechnology, Volume Two Sabu Thomas, Saeedeh Rafiei, Shima Maghsoodlou, Arezo Afzali, 2014-10-24 The collection of topics in this book reflects the diversity of recent advances in nanoelements formation and interactions in nanosystems with a broad perspective that is useful for scientists as well as for graduate students and engineers One of the main tasks in making nanocomposites is building the dependence of the structure and shape of the nanoelements forming the basis for the composite of their sizes This is because with an increase or a decrease in the specific size of nanoelements their physical

mechanical properties such as the coefficient of elasticity strength and deformation parameter vary by over one order The calculations show that this is primarily due to a significant rearrangement of the atomic structure and the shape of the nanoelement The investigation of the above parameters of the nanoelements is technically complicated and laborious because of their small sizes When the characteristics of powder nanocomposites are calculated it is also very important to take into account the interaction of the nanoelements since the changes in their original shapes and sizes in the interaction process and during the formation of the nanocomposite can lead to a significant change in its properties and a cardinal structural rearrangement In addition the studies show the appearance of the processes of the ordering and self assembling leading to a more organized form of a nanosystem The above phenomena play an important role in nanotechnological processes They allow nanotechnologies to be developed for the formation of nanostructures by the self assembling method which is based on self organizing processes and building up complex spatial nanostructures consisting of different nanoelements The study of the above dependences based on the mathematical modeling methods requires the solution of the aforementioned problem at the atomic level This requires large computational aids and computational time which makes the development of economical calculation methods urgent The objective of this volume is the development of such a technique in various nanosystems
