## Endocrine System: WORKING TOGETHER

Endocrine system works with other systems within the body to do "jobs". See below to learn just some of the ways that the endocrine system interacts with other organ systems.

Nervous System	Circulatory System
----------------	--------------------

## Endocrine System: PROBLEMS

Most of the time, the endocrine system works perfectly well. However, sometimes problems can arise.

**Hypothyroidism:** Hypothyroidism is a condition that causes high blood glucose (sugar) levels. It is caused by the thyroid failing to release enough thyroid hormone. This causes the body to burn sugar more slowly than normal. Symptoms include increased weight and exhaustion, slow metabolism, fatigue, depression, weight changes, constipation, acne, irregular or stopping of the periods.

## Endocrine System: KEY TERMS

Term	Definition
Hormones	Chemical messengers that move from one cell to another throughout the body.
Pituitary	A glandular structure located at the base of the brain that controls many other glands.

## Endocrine System: FACTS

- Endocrine glands are found in every part of the body.
- Endocrine glands produce hormones.
- Hormones travel through the blood to target organs.
- Endocrine glands are controlled by the nervous system.

## Endocrine System: FUNCTIONS

The endocrine system is a network of glands that produce hormones. Hormones are the body's chemical messengers that carry information and instructions from one cell to another. Hormones control many important processes in our bodies.

Function of the Endocrine System

## Endocrine System: HORMONES

Hormones are chemical agents, manufactured and released into a person's body that have a specific effect on other cells or organs. What these hormones accomplish and how far they travel depends on their chemical structure. They may be proteins, amino acids, or nucleic acids. Some hormones act locally, while others travel throughout the body to affect other cells.

## Endocrine System: FIGHT-OR-FLIGHT

The fight-or-flight response is a reaction that occurs in the body when we are under stress. This form of stress can either increase the chances that our survival instinct has been triggered, or it can lead to feelings of threat or apprehension. These could either lead to flight (the fight-or-flight response) or fear (the freeze response). This body's fight-or-flight response is triggered by the release of hormones that prepare the body to either run and flee with a focus on our survival ability. In other words, the body's fight-or-flight response depends on its focus on the danger.

Today, we are not frequently faced with flight or freeze events. Instead, our body's fight-or-flight response is triggered by situations that are perceived as a threat, but they have no real danger. The diagram below shows the hormones that are released and the effect that they have on the body.

## Endocrine System: GLANDS

An endocrine gland is a group of cells that perform a specific function in the body. There are two main types of endocrine glands: ductless glands that release their hormones directly into the blood, and ducted glands that release their hormones into a duct, which then carries the hormones to a target organ.

Endocrine glands release hormones that regulate various body functions throughout the body.

## Endocrine System: FEEDBACK LOOPS

Homeostatic feedback loops are regulated by negative feedback & homeostasis. Homeostatic feedback loops are self-correcting. When a body part reaches a set point, a signal goes to that part to stop. If the body part goes past that point, the hormone and signal go back to that part to start again.
