

Gene Expression—Transcription

How is mRNA synthesized and what message does it carry?

Why?

DNA is often referred to as a genetic blueprint. In the same way that blueprints contain the instructions for construction of a building, the DNA found inside the nuclei of cells contains the instructions for assembling a living organism. The DNA blueprint carries its instructions in the form of genes. In most cases the genes direct the production of a polypeptide, from which other more complex proteins, such as enzymes or hormones, may be constructed. These polypeptides and other molecules run the organism's metabolism and, in multicellular organisms, dictate what each cell's job is. So, what is the language of these instructions and how are they read and decoded by the cellular organelles? This activity will focus on the decoding of genes in eukaryotes.

and reversal of transcriptional states that are fundamental for the cell's ability to memorize past events such as changes in the external environment, social sphere or developmental cues. External signals trigger changes in the epigenome allowing cells to respond dynamically. Internal signals direct activities that are necessary for body maintenance and repairing damaged tissues and organs. With the emergence of epigenetic memory, organisms can fix historical and context-dependent, impressive experiences. Evolution from now on: learnt to learn. Learning means organisms can avoid reproduction of always the same. This is key to adaptation. However, inheritance of acquired characteristics is only one of the many examples of the explanatory power of epigenetics. Behavioral epigenetics demonstrates the way in which environmental and social experiences produce individual differences in behaviour, cognition, personality and mental health. This book assembles experts to outline the various motifs of all kinds of epigenetic regulation of cells throughout their lives. **EBOOK: Molecular Biology** Robert Weaver, 2011-03-16.
