**Geometry by Its Transformations**

Christopher Baltus, 2025-02-07 This textbook combines the history of synthetic geometry centered on the years 1800-1855 with a theorem proof exposition of the geometry developed in those years. The book starts with the background needed from Euclid's Elements followed by chapters on transformations including dilation, similitude, homology, homogeneous coordinates, projective geometry, inversion, the Möbius transformation, and transformation geometry as in French schoolbooks of 1910. Projective geometry is presented by tracing its path through the work of J. V. Poncelet, J. Steiner, and K. G. C. von Staudt. Extensive exercises are included, many from the period studied. The prerequisites for approaching this course are knowledge of high school geometry and enthusiasm for mathematical demonstration. This textbook is ideal for a college geometry course for self study or as preparation for the study of modern geometry. *Spectrum Critical Thinking for Math, Grade 8*
