simulation of flow past tubular heat exchangers or submarine towed sensor arrays and the flow about parachute ribbons In
the present work a vortex method is used for solving the unsteady flow field This method demonstrates inherent advantages
over more conventional grid based computational fluid dynamics The vortex method is non iterative does not require artificial
viscosity for stability displays minimal numerical diffusion can easily treat moving boundaries and allows a greatly reduced
computational domain since vorticity occupies only a small fraction of the fluid volume A gridless approach is used in the flow
