Realistically representing our three dimensional world has been the subject of many philosophical discussions since ancient times While the recognition of the globular shape of the Earth goes back to Pythagoras statements of the sixth century B C the two dimensional circular depiction of the Earth

s surface has remained prevailing and also dominated the art of painting until the late Middle Ages. Given the immature technological means, objects on the Earth's surface were often represented in academic and technical disciplines by two-dimensional cross sections oriented along combinations of three mutually perpendicular directions. As soon as computer science evolved, scientists have steadily been improving the three-dimensional representation of the Earth and developed techniques to analyze the many natural processes and phenomena taking part on its surface. Both computer-aided design (CAD) and geographical information systems (GIS) have been developed in parallel during the last three decades. While the former concentrates more on the detailed design of geometric models of object shapes, the latter emphasizes the topological relationships between geographical objects and analysis of spatial patterns. Nonetheless, this distinction has become increasingly blurred, and both approaches have been integrated into commercial software packages. In recent years, an active line of inquiry has emerged along the junctures of CAD and GIS, viz. 3D geoinformation science. Studies along this line have recently made significant inroads in terms of 3D modeling and data acquisition.

Flood Risk Management Brototi Biswas, Bhagwan Balasaheb Ghute, 2024-05-26. This book examines the nature of flood in different landscapes and the various factors that contribute to flooding in different areas. It identifies flood risk zones in different terrain types and provides valuable insights into the anthropogenic, geographical, hydrogeological, and geomorphological aspects of flood-prone areas to achieve sustainable risk management. The book also explores the impact of avalanches, global warming, and flash floods in different settings where such types of flooding have become more common. In addition, the volume provides case studies to evaluate the impact of flooding in both natural and man-made environments. To better understand and manage floods, the book combines advanced geospatial tools and techniques with indigenous knowledge. Using machine learning and multiple criteria decision analysis, the book provides an amalgamation of technology and indigenous knowledge to assess flood susceptibility. The book also includes strategies to manage flood risks and case studies that demonstrate best practices in flood risk management. The volume is a valuable resource for researchers, students, and policy makers to understand the causes of floods and their socio-economic impact in different areas.
