Photoelectron and Auger Spectroscopy Thomas Carlson, 2013-11-11

In 1970 when I first seriously contemplated writing a book on electron spectroscopy I recognized the impossibility of completely reaching my desired goals First the field was expanding and still is at such a rate that a definitive statement of the subject is not possible The act of following the literature comprehensively and summarizing its essential content proved to be a divergent series On the other hand the field has increased to such a size that violent changes in its basic makeup no longer occur with the frequency that was present in its early days Furthermore the excitement of electron spectroscopy lies in its many faceted interrelationships In the era of specialization electron spectroscopy is an open ended subject continually bringing together new aspects of science I wished to discuss not just one type of electron spectroscopy but as many as would be possible The book as it stands concentrates its attention on x ray photoelectron spectroscopy but also presents the basis of Auger electron spectroscopy and uv photoelectron spectroscopy as well as mentioning many of the other branches of the field A large many author volume might be an answer to some of these problems However though anyone person possesses only a limited amount of expertise I have always enjoyed books by a single author since what they lack in detailed knowledge they gain in a unified viewpoint I hope the final product though limited in its attainment of these goals will still be of some merit

Forrest, 2020 This textbook provides a basic understanding of the principles of the field of organic electronics through to their applications in organic devices Useful for the student and practitioner it is both a teaching text and a resource that is a jumping off point for learning working and innovating in this rapidly growing field Provided by publisher [Electronic Structure of \$\pi\$ -Conjugated Materials and Their Effect on Organic Photovoltaics](#) Chuanfei Wang, 2017-11-15 The great tunability of structure and electronic properties of conjugated organic molecules polymers combined with other advantages such as light weight and flexibility etc have made organic based electronics the focus of an exciting still growing field of physics and chemistry for more than half a century The application of organic electronics has led to the appearance of wide range of organic electronic devices mainly including organic light emitting diodes OLED organic field effect transistors OFET and organic solar cells OSC The application of the organic electronic devices mainly is limited by two dominant parameters i.e. their performance and stability Up to date OLED has

been successfully commercialized in the market while the OSC are still on the way to commercialization hindered by low efficiency and inferior stability Understanding the energy levels of organic materials and energy level alignment of the devices is crucial to control the efficiency and stability of the OSC In this thesis energy levels measured by different methods are studied to explore their relationship with device properties and the strategies on how to design efficient and stable OSC based on energy level diagrams are provided Cyclic Voltammetry CV is a traditional and widely used method to probe the energy levels of organic materials although there is little consensus on how to relate the oxidation reduction potential E_{ox} to the vacuum level Ultraviolet Photoelectron Spectroscopy UPS can be used to directly detect vertical ionization potential IP of organic materials In this thesis a linear relationship of IP and E_{ox} was found with a slope equal to unity The relationship provides for easy conversion of values obtained by the two techniques enabling complementary use in designing and fabricating efficient and stable OSC A popular rule of thumb is that the offset between the LUMO levels of donor and acceptor should be 0.3 eV according to which a binary solar cell with the minimum voltage losses around 0.49 V was designed here Introduction of the ternary blend as active layer is an efficient way to improve both efficiency and stability of the OSC Based on our studied energy level diagram within the integer charge transfer ICT model we designed ternary solar cells with enhanced open circuit voltage for the first time and improved thermal stability compared to reference binary ones The ternary solar cell with minimum voltage losses was developed by combining two donor materials with same ionization potential and positive ICT energy while featuring complementary optical absorption Furthermore the fullerene acceptor was chosen so that the energy of the positive ICT state of the two donor polymers is equal to the energy of negative ICT state of the fullerene which can enhance dissociation of all polymer donor and fullerene acceptor excitons and suppress bimolecular and trap assisted recombination Rapid development of non fullerene acceptors in the last two years affords more recipes of designing both efficient and stable OSC We show in this thesis how non fullerene acceptors successfully can be used to design ternary solar cells with both enhanced efficiency and thermal stability Besides improving the efficiency of the devices understanding of the stability and degradation mechanism is another key issue The degradation of conjugated molecules polymers often follow many complicated pathways and at the same time many factors for degradation are coupled with each other Therefore the degradation of non fullerene acceptors was investigated in darkness by photoelectron spectroscopy in this thesis with the in situ method of controlling exposure of O₂ and water vapor separately
