Clark,2013-11-27 The aim of this manual is to encompass a broad range of the latest plant molecular biology techniques However it is acknowledged that any manual will be read and hopefully used by a wide range of people with different levels of experience Hence the remit of the manual was widened to include a full range of basic molecular techniques so that novices do not have to consult several texts to enable the execution of each major experiment The manual is divided into three main parts Part I Basic Molecular Techniques The reason behind this part is to provide a background knowledge of molecular techniques but also to reduce duplication in later chapters this is particularly true of the methods contained in Chap 1 All authors provided very detailed methods and often forgot that some of these would be covered earlier A particular favourite was DNA extraction methods where everyone managed to provide a slightly different variant My view was that it is far less confusing for the reader to be presented with one standard protocol and accompanying troubleshooting tips than to read a different version in each chapter In this way the basic techniques are addressed more in depth and my apologies to all authors for judicious use of the delete key RNA methodology is covered in Chapter 3 This proceeds from the fundamentals of extraction northern blotting etc to cDNA libraries **Molecular Markers in Mycology** Bhim Pratap Singh,Vijai Kumar Gupta,2017-01-21 The Kingdom fungi encompass a massive diversity of taxa with wide ranging ecologies life cycles and morphologies ranging from unicellular aquatic chytrids to large mushrooms Before molecular methods came in existence taxonomists considered this Kingdom to be a member of the plant kingdom due to certain life styles like immobility and growth habitats Molecular markers also known as DNA markers facilitated a better alternative method over traditional morphological methods employed for the identification characterization and to understand the evolution of fungi The morphological methods used for identification are mainly dependent on spore color or microscopic features whereas molecular markers are based on DNA polymorphism in the genomic organization Phylogenetic studies reported in last decade based on molecular markers have reshaped the classification system of Kingdom fungi which divided into one subkingdom seven phyla and ten subphyla Recent advances in molecular mycology have opened the way for researchers to identify and characterize novel fungal species from unique environments Mycology is concerned with the systematic study of fungi including their genetic and biochemical properties their use to humans as a source of medicine and food as well as their

dangers such as poisoning and infections In the 21st century with the development of DNA sequencing technologies and phylogenetic analysis based on molecular markers new insights into fungal taxonomy were provided This book contains a thorough discussion of molecular characterization and detection of different groups of fungi by using PCR based markers and provides a comprehensive view of the applications and uses of different molecular markers in molecular mycology It also addresses the recent molecular markers employed to solve the problems of identification and discusses current approaches used in molecular characterization and detection of fungi

Legume Breeding in Transition: Innovation and Outlook Rafiul Amin Laskar,Aamir Raina,Samiullah Khan,Nasya Borisova Tomlekova,Waltram Ravelombola,Mahendar Thudi,2023-09-06 Legumes family Fabaceae comprise a diverse range of crops grown worldwide which are important constituents of sustainable agriculture and harbour a role in improving human and livestock health Legumes serve as a rich source of plant based proteins rank second in nutrition value after cereals and are ideal to supplement a protein deficient cereal based human diet Legumes also provide other essential services to agriculture through their ability to fix atmospheric nitrogen recycle

nutrients enhance soil carbon content and diversify cropping systems Legume production and seed quality are affected by a range of biotic pests insect diseases and weeds and abiotic stresses drought heat frost and salinity In addition to this rapidly changing climate shrinking arable land erratic rainfalls and depleting water and other natural resources impact legume production and threaten food and nutrition security worldwide Persistent demand for legume crops is existing to fulfil the food requirements of an ever growing human population Therefore legume breeders and geneticists have employed different conventional and modern breeding strategies to improve yield resistance to biotic and abiotic stresses grain quality and nutritional and nutraceutical properties Conventional breeding strategies are laborious time consuming expensive and inefficient to achieve the desired goals However advanced breeding techniques such as alien gene introgression genomics assisted breeding transgenic technology speed breeding association and mapping studies genome editing and omics will contribute to sustainable agriculture and food security
