Meeting the Challenges to Measurement in an Era of Accountability Henry Braun, 2016-01-29 Under pressure and support from the federal government states have increasingly turned to indicators based on student test scores to evaluate teachers and schools as well as students themselves The focus thus far has been on test scores in those subject areas where there is a sequence of consecutive tests such as in mathematics or English language arts with a focus on grades 4-8 Teachers in these subject areas however constitute less than thirty percent of the teacher workforce in a district Comparatively little has been written about the measurement of achievement in the other grades and subjects This volume seeks to remedy this imbalance by focusing on the assessment of student achievement in a broad range of grade levels and subject areas with particular attention to their use in the evaluation of teachers and schools in all It addresses traditional end of course tests as well as alternative measures such as portfolios exhibitions and student learning objectives In each case issues related to design and development psychometric considerations and validity challenges are covered from both a generic and a content specific perspective The NCME Applications of Educational Measurement and Assessment series includes edited volumes designed to inform research based applications of educational measurement and assessment Edited by leading experts these books are comprehensive and practical resources on the latest developments in the field The Open Access version of this book available at <http://www.taylorfrancis.com> has been made available under a Creative Commons Attribution Non Commercial No Derivatives 4.0 license

What levels of explanation in the behavioural sciences? Giuseppe Boccignone,Roberto Cordeschi,2015-07-03 Complex systems are to be seen as typically having multiple levels of organization For instance in the behavioural and cognitive sciences there has been a long lasting trend promoted by the seminal work of David Marr putting focus on three distinct levels of analysis the computational level accounting for the What and Why issues the algorithmic and the implementational levels specifying the How problem However the tremendous developments in neuroscience knowledge about processes at different scales of organization together with the complexity of today cognitive theories suggest that there will hardly be only three levels of explanation Instead there will be many different degrees of commitments corresponding to the different granularities from high level behavioural models to low level neural and molecular models of the cognitive research program For instance Bayesian approaches that are usually advocated for formalizing Marr s computational level and rational behaviour have even been adopted to model synaptic plasticity and axon guidance by molecular gradients As a result we can consider the behavioural scientist as dealing with models at a multiplicity of levels The purpose of this Research Topic in Frontiers in Theoretical and Philosophical Psychology is to promote an approach to the role of the levels and explanation and models which is of interest for cognitive scientists neuroscientists psychologists behavioural scientists and philosophers of science

Biomechanical forces play a major role in organ development shape and function When exceeding the physiological range however they may become detrimental for organ structure and function This is probably best exemplified by the cardiovascular system with both the heart and blood vessels being continuously exposed to the biomechanical forces exerted by the flow of blood In the heart it is the build up of pressure inside the ventricles that allows the ejection of blood into the pulmonary and systemic circulation The luminal diameter of the small arteries in both parts of the circulation determines the resistance to flow Hence it also determines the level of blood pressure in both the pulmonary and systemic circulation and thus the afterload for both ventricles of the heart A narrowing of the small arteries e g due to an increase in tone therefore leads to an increase in blood pressure in the affected part of the circulation This will decrease organ perfusion but increase the afterload for the corresponding ventricle of the heart Consequently the affected ventricle must build up more pressure to maintain cardiac output However if the rise in blood pressure pulmonary or arterial hypertension persists the increase in wall tension can no longer be compensated by active constriction thereby forcing the ventricle to resort to other means to unload itself Typically this is achieved by structural alterations in its wall which becomes thicker hypertrophy and stiffer remodelling of the extracellular matrix Ultimately this maladaptive response may lead to dysfunction and eventually failure of the ventricle which would only be able to eject a significantly smaller amount of blood into circulation The increase in wall tension has resulted in an increased stretching of the cardiomyocytes as well as non cardiomyocytes such as cardiac fibroblasts which in turn alters both their phenotype and their environment Research into the mechanobiology of the heart aims to unravel the molecular and cellular mechanisms underlying the physiological response of the heart to load to learn what goes wrong when the heart is faced with sustained pressure overload This may pave the way to therapeutically interfering with this maladaptive response and thus preventing either the initial hypertrophy or its transition into heart failure While the heart is mainly subjected to pressure hence stretch as a biomechanical force the mechanobiology of vascular cells is somewhat more complex Endothelial cells lining the luminal surface of each blood vessel are continuously subjected to the viscous drag of flowing blood referred to as fluid shear stress Fluid shear stress mainly affects the endothelial cells of the small arteries and arterioles maintaining them in a dormant phenotype If blood flow is disturbed e g at arterial bifurcations or curvatures fluid shear stress declines and may give rise to a shift in phenotype of the endothelial cells A shift from anti inflammatory to pro inflammatory in combination with the reduced flow at these sites may enable leukocyte recruitment and diapedesis which results in a pro inflammatory response in the vessel wall Endothelial cells and in particular vascular smooth muscle cells are subjected to another biomechanical force the blood pressure Volume dependent

distention of the vessel wall which can be achieved through an increase in blood flow results in an increase in wall tension thereby stretching of the endothelial and smooth muscle cells Like the cardiomyocytes of the heart the vascular smooth muscle cells of the small arteries and arterioles try to normalise wall tension by active constriction which cannot be maintained for long These cells subsequently undergo hypertrophy or hyperplasia depending on the size of the blood vessel and remodel the extracellular matrix so that the vessel wall also becomes thicker and stiffer This in turn raises their resistance to flow and may contribute to the increase in blood pressure in either the pulmonary or systemic circulation Research into the mechanobiology of the blood vessels aims to unravel the molecular and cellular mechanisms underlying the physiological response of the vascular cells to pressure wall tension and flow shear stress It also aims to uncover what goes wrong e g in arteriosclerosis or hypertension and to eventually specifically interfere with these maladaptive remodelling processes The aforementioned aspects of cardiovascular mechanobiology along with many more facets of this fascinating timely and highly clinically relevant field of research are addressed by the original research and review articles within this Research Topic
