Functional Characterization of Insect Chemoreceptors: Receptivity Range, Expression and Evolution William B. Walker,Emmanuelle Jacquin-Joly,Sharon R. Hill,2016-06-11 Olfaction and taste are of critical importance to insects and other animals since vital behaviours including mate food and host seeking as well as predator and toxin avoidance are guided by chemosensory cues Mate and habitat choice are to a large extent determined by chemical signals and chemoreceptors contribute accordingly to pre mating isolation barriers and speciation In addition to fundamental physiological ecological and evolutionary consideration the knowledge of insect taste and especially olfaction is also of great importance to human economies since it facilitates a more informed approach to the management of insect pests of agricultural crops and forests and insect vectors of disease Chemoreceptors which bind to external chemical signals and then transform and send the sensory information to the brain are at the core of the peripheral olfactory and gustatory system and have thus been the focus of recent research in chemical ecology Specifically emphasis has been placed on functional characterization of olfactory receptor genes which are derived from three large gene families namely the odorant receptors gustatory receptors and ionotropic receptors Spatial expression patterns of olfactory receptors in diverse chemosensory tissues provide information on divergent functions with regards to ecologically relevant behaviours On the other hand characterization of olfactory receptor activation profiles or deorphanization provides complimentary data on the molecular range of receptivity to the fundamental unit of the olfactory sense The aim of this Research Topic is to give an update on the breadth and depth of research currently in progress related to understanding the molecular mechanisms of insect chemoreception with specific emphasis on the olfactory receptors

Crop Traits for Defense Against Pests and

Disease: Durability, Breakdown and Future Prospects, 2nd Edition Alison J. Karley, Scott N. Johnson, Rex Brennan, Peter J. Gregory, 2019-04-17 With global populations expected to exceed 9.2 billion by 2050 and available land and water resources devoted to crop production dwindling we face significant challenges to secure global food security. Only 12 plant species feed 80% of the world's population with just three crop species wheat, rice and maize accounting for food consumed by 50% of the global population. Annual losses to crop pests and pathogens are significant, thought to be equivalent to that required to feed a billion people at a time when crop productivity has plateaued. With pesticide applications becoming increasingly unfeasible on cost, efficacy and environmental grounds, there is growing interest in exploiting plant resistance and tolerance traits for crop protection. Indeed, mankind has been selectively breeding plants for desirable traits for thousands of years. However, resistance and tolerance traits have not always been those most desired and in many cases have been inadvertently lost during the domestication process. Crops have been effectively disarmed by domestication. Moreover, mechanistic understanding of how resistance and tolerance traits operate is often incomplete, which makes identifying the right combination for crop protection difficult. We aimed to address this Research Topic by inviting authors to contribute their knowledge of appropriate resistance and tolerance traits, explore what is known about durability and breakdown of defensive traits, and finally asking what are the prospects for exploiting these traits for crop protection. The research topic summarised in this book addresses some of the most important issues in the future sustainability of global crop production.

Microbial Control of Insect and Mite Pests Lawrence A. Lacey, 2016-09-03 Microbial Control of Insect and Mite Pests: From Theory to Practice is an important source of information on microbial control agents and their implementation in a variety of crops and their use against medical and veterinary vector insects in urban homes and other structures, in turf and lawns, and in rangeland and forests. This comprehensive and enduring resource on entomopathogens and microbial control additionally functions as a supplementary text to courses in insect pathology, biological control, and integrated pest management. It gives regulators and producers up-to-date information to support their efforts to facilitate and adopt this sustainable method of pest management. Authors include an international cadre of experts from academia, government, research agencies, technical representatives of companies that produce microbial pesticides, agricultural extension agents with hands-on microbial control experience in agriculture and forestry, and other professionals working in public health and urban entomology. Covers all pathogens including nematodes. Addresses the rapidly progressing developments in insect pathology and microbial control, particularly with regard to molecular methods. Demonstrates practical use of entomopathogenic microorganisms for pest control.
