The published results have been studied to extract the effect on spinning of aircraft geometry control surface effectiveness flight operational parameters and atmospheric effects Consideration is also made of the influence on human performance of spinning the current spin regulations and the available training material for pilots A conventional geometry single engine low wing aeroplane the basic trainer Fuji FA 200 160 has been instrumented with a proven digital flight measurement system and 27 spins have been systematically conducted inside and outside the certified flight envelope The accuracy of the flight measurements is ensured through effective calibration and the choice of sensors has varied through the study with earlier sensors suffering from more drift than the current sensors Belcastro 2009 and Schrader 2013 In flight parameter data collected includes left and right wing and angles roll pitch yaw angles and corresponding rates all control surface deflections vertical speeds altitude losses and the aeroplane's accelerations in all three directions Such data have been statistically analysed. The pitch behaviour has

been mathematically modelled on the basis of the gathered flight test data Nine observations have been proposed These mainly cover the effects of centre of gravity and aircraft mass variations on spin characteristic behaviour They have all been proven as true through the results of this thesis The final observation concerns the generalisation of the Fuji results to the spin behaviour of other aircraft in the same category These observations can be used to improve flight test programmes aircraft design processes flight training materials and hence contribute strongly to better flight safety **Moody's Manual** of Investments and Security Rating Service ,1926 The Fujifilm X-T10 Rico Pfirstinger, 2015-11-28 Fuji Fire Chas Department of the Interior and Related Agencies Appropriations for 1993: Public witnesses for energy programs United States.
