

# Invasive Species

"Invasive species" — it doesn't sound very threatening, does it? But these invaders, large and small, have devastating effects on U.S. wildlife. **Invasive species are one of the leading threats to native wildlife.** Approximately 42% of Threatened or **Endangered species** are at risk primarily due to invasive species.

Human health and economies are also at risk from invasive species. The impacts of invasive species on our natural ecosystems and economy cost billions of dollars each year. Many of our commercial, agricultural, and recreational activities depend on healthy native ecosystems.

## What makes a species invasive?

An invasive species can be any kind of living organism—an amphibian (like the cane toad pictured left), plant, insect, fish, fungus, bacteria, or even an organism's seeds or eggs—that is not native to an ecosystem and which causes harm. They can harm the environment, the economy or even, human health. Species that grow and reproduce quickly, and spread aggressively, with potential to cause harm, are given the label of "invasive".

An invasive species does not have to come from another country. For example, lake trout are native to the Great Lakes, but are considered to be an invasive species in Yellowstone Lake in Wyoming because they compete with native cutthroat trout for habitat.

## How do invasive species spread?

Invasive species are primarily spread by human activities, often unintentionally. People, and the goods we use, travel around the world very quickly, and they often carry uninvited species with them.

- **Ships:** Ships can carry aquatic organisms in their ballast water.
- **Wood products:** Insects can get into wood, shipping palettes and crates that are shipped around the world.
- **Ornamental plants:** Some ornamental plants can escape into the wild and become invasive.
- **Pet trade:** Some invasive species are intentionally or accidentally released pets. Burmese pythons are becoming a big problem in the Everglades.

## Why do invasive species pose such a threat?

Invasive species cause harm to wildlife in many ways. When a new and aggressive species is introduced into an ecosystem, it might not have any natural predators or controls. It can breed and spread quickly, taking over an area. Native wildlife may not have evolved defenses against the invader or they cannot compete with a species that has no predators.
