the response time and a high control gain can be considered as the most critical factors affecting a sulphide control strategy in bioreactors. The delays are caused by the induction of different metabolic pathways in the anaerobic sludge including the accumulation of storage products. On this basis a mathematical model was developed and validated. This can be used to develop optimal control strategies. In order to understand the microbial pathways in the anaerobic oxidation of methane coupled to sulphate reduction (AOM SR), diverse potential electron donors and acceptors were added to in vitro incubations of an AOM SR enrichment at high pressure. Acetate was formed in the control group, probably resulting from the reduction of CO₂. These results support the hypothesis that acetate may serve as an intermediate in the AOM SR process. **The**
