

Transcription Factors

While both prokaryotes and eukaryotes have promoter regions, eukaryotes have an extra region to help with regulation (turning on or off genes) called the enhancer region.

Enhancer regions simplify transcription when specific transcription factors, called activators, attach.

When specific transcription factors (activators) attach to the enhancer region, the DNA bends. The activators and general transcription factors all interact which will then allow RNA polymerase to attach to the promoter sequence and initiate transcription.

The gene is expressed!
