I. Manin, Alexei A. Panchishkin, 2013-04-17 Preface Among the various branches of mathematics number theory is characterized to a lesser degree by its primary subject integers than by a psychological attitude Actually number theory also deals with rational algebraic and transcendental numbers with some very specific analytic functions such as Dirichlet series and modular forms and with some geometric objects such as lattices and schemes over  $\mathbb{Z}$  The question whether a given article belongs to number theory is answered by its author s system of values If arithmetic is not there the paper will hardly be considered as number theoretical even if it deals exclusively with integers and congruences On the other hand any mathematical tool say homotopy theory or dynamical systems may become an important source of number theoretical inspiration For this reason combinatorics and the theory of recursive functions are not usually associated with number theory whereas modular functions are In this report we interpret number theory broadly There are compelling reasons to adopt this viewpoint First of all the integers constitute together with geometric images one of the primary subjects of mathematics in general Because of this the history of elementary number theory is as long as the history of all mathematics and the history of modern mathematics began when numbers and figures were united by the concept of coordinates which in the opinion of LR Shafarevich also forms the basic idea of algebra

**Fertilizer Abstracts**, 1969 *Working Fluid Selection for Organic Rankine Cycle and Other Related Cycles* Attila R. Imre, 2020-06-16 The world s energy demand is still growing partly due to the rising population partly to increasing personal needs This growing demand has to be met without increasing or preferably by decreasing the environmental impact One of the ways to do so is the use of existing low temperature heat sources for producing electricity such as using power plants based on the organic Rankine cycle ORC In ORC power plants instead of the traditional steam the vapor of organic materials with low boiling points is used to turn heat to work and subsequently to electricity These units are usually less efficient than steam based plants therefore they should be optimized to be technically and economically feasible The selection of working fluid for a given heat source is crucial a particular working fluid might be suitable to harvest energy from a 90 geothermal well but would show disappointing performance for well with a 80 head temperature The ORC working fluid for a given heat source is usually selected from a handful of existing fluids by trial and error methods in this collection we demonstrate a more systematic method based on physical and chemical criteria **Encyclopedia of Iron, Steel, and Their Alloys**
