## **Introduction To Cardiopulmonary Exercise Testing:**

Introduction to Cardiopulmonary Exercise Testing Andrew M. Luks, Robb W. Glenny, H. Thomas Robertson, 2013-03-22

Cardiopulmonary exercise testing is an important diagnostic test in pulmonary medicine and cardiology. Capable of providing significantly more information about an individual's exercise capacity than standard exercise treadmill or 6 minute walk tests, the test is used for a variety of purposes including evaluating patients with unexplained exercise limitation or dyspnea on exertion, monitoring disease progression or response to treatment, determining fitness to undergo various surgical procedures, and monitoring the effects of training in highly fit athletes. *Introduction to Cardiopulmonary Exercise Testing* is a unique new text that is ideal for trainees. It is presented in a clear, concise, and easy to follow manner and is capable of being read in a much shorter time than the available texts on this topic. Chapters describe the basic physiologic responses observed during sustained exercise and explain how to perform and interpret these studies. The utility of the resource is further enhanced by several sections of actual patient cases which provide opportunities to begin developing test interpretation skills. Given the widespread use of cardiopulmonary exercise testing in clinical practice, trainees in pulmonary and critical care medicine, cardiology, sports medicine, exercise physiology, and occasionally internal medicine will find *Introduction to Cardiopulmonary Exercise Testing* to be an essential and one of a kind reference.

*Computerized Cardiopulmonary Exercise Testing* U.J. Winter, K. Wassermann, N. Treese, H.-W. Höpp, 2012-12-06

The measurement of cardio circulatory and gas exchange parameters during physical exercise, the so called ergo spirometry or cardiopulmonary exercise testing CPX as a basis of pathophysiological and clinical research, has a long tradition in Cologne. Knipping and his coworkers, especially Hollmann, performed basic research work in healthy subjects. In the area of sports medicine, bicycle or treadmill exercise testing with parallel serial lactate determinations has gained increasing importance for the assessment of cardiac functional capacity. Also in other medical disciplines, ergospirometry lost its importance. K Wasserman in Los Angeles is to be credited for having further improved the method to its present standard, a computerized on line measuring and practicable cardiopulmonary exercise testing procedure. The prerequisites were technical innovations such as continuously measuring gas analyzers and personal computers. Thereby the knowledge about physiology, pathophysiology, and clinical circumstances of cardiocirculatory and respiratory regulation during exercise were significantly extended. The working groups of W Hollmann, Cologne and K Wasserman, Los Angeles determined normal values for the gas exchange parameters and derived values for healthy normals in large populations. Wasserman and coworkers were able to introduce a differential diagnostic concept for patients suffering from various cardiovascular and cardiopulmonary diseases. Many cardiologists working for example in myocardial failure or with rate adaptive pacemakers belong to those who recommended the modern computerized ergo spirometry. Furthermore, this method is controversially discussed by colleagues working in sports medicine and pulmonary function.
