Identification Guide of Freshwater Macroinvertebrates of Spain Javier Oscoz, David Galicia, Rafael Miranda, 2011-06-27 As a result of the European Commission's concern for the status of continental waters and as a clear reflection of the notion of water as heritage to be conserved in the year 2000 the Water Framework Directive 2000/60/CE was enacted its goal being to establish a framework to protect water and the different aquatic ecosystems by requiring the Member States to achieve a good ecological status in all their waters by 2015 Like all ecosystems freshwater ecosystems undergo physical chemical and energy related changes both of natural and anthropogenic origin These disturbances affect the organisms living in them and those who utilize their resources Therefore evaluating these changes has become a very important task in order to better understand aquatic systems The study and analysis of the ecological status of these ecosystems in relation to their conservation status and water quality is thus a fundamental tool for a more efficient and

rational management of their resources that is a management that does not threaten the ecosystem The present guide for the identification of Spanish freshwater macroinvertebrates aims to facilitate the job of those who go to great lengths to identify them in order to then determine biotic indices It is not the aim of this book to serve as a zoological treaty nor does it claim to add new information on the biology or the ecology of the taxa covered This book is simply a working tool explicitly designed to facilitate the identification of the Spanish macroinvertebrates and the subsequent computing of biotic indices

The Biology and Ecology of Streams and Rivers Alan Hildrew, Paul Giller, 2023-06-19 The challenges that the world's running water systems now face have never been more numerous or acute at the same time these complex habitats remain absolutely crucial to human wellbeing and future survival If rivers can ever be anything like sustainable ecology needs to take its place as an equal among the physical sciences such as hydrology and geomorphology A real understanding of the natural history and ecology of running waters must now be brought even more prominently into river management The primary purpose of this textbook is to provide the up to date overview that students and practitioners will require to achieve this aim The book's unifying focus is on rivers and streams as ecosystems in which the particular identity of organisms is not the main emphasis but rather the processes in which they are involved specifically energy flow and the cycling of materials It builds on the physicochemical foundations of the habitat template and explores the diversity and adaptations of the biota progressing from the population and community ecology of organisms and linking them to ecosystem processes and services in the wider biosphere via the complexities of species interactions and food webs These include water quality and patterns of river discharge as well as aesthetics waste disposal and environmental health While the book is not primarily focused on application per se each chapter addresses how humans affect rivers and in turn are affected by them A final future oriented chapter identifies key strategic areas and sets a roadmap for integrating knowledge of natural history and ecology into policy and management The Biology and Ecology of Streams and Rivers is an accessible text suitable for both senior undergraduate and graduate students taking courses in both lotic and general ecology as well as more established researchers practitioners managers and conservationists requiring a concise and contemporary overview of running waters
