LANSING®****1607A
MIXER/POWER AMPLIFIER****OPERATING
INSTRUCTIONS****OPERATION****CONTROLS AND INDICATORS**

All normal operating controls are on the front panel. Installation and service adjustments include a tone control in-out switch on the preamplifier board, and a power driver balance control on the power driver board. Control and indicator functions are described in Table I.

WRITE-IN BLOCKS

The write-in blocks above the six gain controls may be marked with a soft lead pencil to identify use. To remove writing, use a damp cloth — never use a pencil eraser or other abrasive material because the writing surfaces will become unusable.

NORMAL GAIN SETTINGS

For average input signals, the MASTER gain control should be set to approximately 14 dB. This allows maximum flexibility in setting individual mixer gain controls (MIX 1, MIX 2, MIX 3, MIX 4 and MIX 5) to the desired operating level for respective input channels. If one input is unusually low, it may be necessary to increase the MASTER gain control setting and operate the other inputs at a proportionately lower gain setting. A recommended procedure is to divide the losses equally between the MASTER and MIX gain controls.

VU METER ACCESSORY

The 1607A output may be indicated in VU with the VU meter accessory. The range of the meter is selected with the VU METER switch. The VU meter accessory is operated by switching the VU METER switch from OFF to the desired range: +37 VU, +40 VU, +43 VU or +45 VU.

The upper scale of the VU meter is calibrated in VU from -20 VU to +3 VU. A value in VU of the 1607A output is obtained by adding the range setting to the meter indication. Example: An indication of -2 VU on the meter with a range setting of +43 VU means the 1607A output is +41 VU.

The VU meter gives direct indication of sine wave output. A value of +43 VU indicates an output of 20 watts and a value of +45 VU indicates an output of 50 watts (see Table II).

VU meter indications are approximately 10 dB below peak output of voice and music program material because the meter cannot follow such rapidly changing signal peaks. Thus for an indication of +43 VU, the output may be assumed to have peaks of 200 watts.

The relationship between indicated VU and output power in watts (with normal settings of MIX and MASTER gain controls) is

shown in Table II. Approximate output of the 1607A can therefore be set in accordance with the listed values.

COMPRESSOR ACCESSORY

Excessively high input-signal peaks may be controlled with the Compressor accessory. The compression threshold to which the signal must rise before compression begins is selected with the COMPRESSION THRESHOLD switch. The Compressor accessory is operated by switching the COMPRESSION THRESHOLD switch from OFF to the desired threshold: +37 VU, +40 VU, +43 VU or +45 VU.

A family of amplifier performance curves is presented in Figure 1 for the different compressions. With no compression (switch in OFF position), amplifier performance follows the "0 dB COMPRESSION" curve. Performance of the 1607A for any compression follows the "0 dB COMPRESSION" curve to the intersection of the selected COMPRESSION THRESHOLD curve and then follows the reduced slope of that curve. Reduction in output is a ratio of five to one.

Dashed COMPRESSION lines are shown in 5 dB increments. The intersection of these COMPRESSION lines with the COMPRESSION THRESHOLD curves shows input/output values for input levels reduced by 5, 10, 15 or 20 dB.

Specifications and components subject to change without notice. Overall performance will be maintained or improved.
