 - o Connection mirroring is not recommended on a virtual server with client side SSL, because the connection will have to be renegotiated after the failover anyway.

- Determine an appropriate location to take the capture
 - o One method is to start in the middle, typically at the BIG-IP. Capture clientside traffic and server side traffic. Compare the two to discover anomalies.
 - o Another method (depends on configuration and resources), is a clientside approach. Perform a packet capture on the client computer while accessing application through BIG-IP and perform another packet capture while accessing the application directly on the same client computer. Compare the two to discover anomalies.
 - o Sometimes a combination of the two is required to gather a full understanding of the problem.
 - o Filter packet captures by interface or VLAN, and hosts in question (client IP, VIP, Server IP/s)
- Determine the appropriate time to take the capture
