Erickson, 2007-05-08 We have written this book as a guide to the design and analysis of field studies of resource selection concentrating primarily on statistical aspects of the comparison of the use and availability of resources of different types Our intended audience is field ecologists in general and in particular wildlife and fisheries biologists who are attempting to measure the extent to which real animal populations are selective in their choice of food and habitat As such we have made no attempt to address those aspects of theoretical ecology that are concerned with how animals might choose their resources if they acted in an optimal manner The book is based on the concept of a resource selection function RSF where this is a function of characteristics measured on resource units such that its value for a unit is proportional to the probability of that unit being used We argue that this concept leads to a unified theory for the analysis and interpretation of data on resource selection and can replace many ad hoc statistical methods that have been used in the past **Manual of Customs, Precedents, and Forms in Use in the Assembly of Wisconsin** , 1869 **Airman's**
