Clinical Benefits of Leukodepleted Blood Products Joseph Sweeney, 2013-06-29 Joseph Sweeney Andrew Heaton The presence of allogeneic leukocytes in blood products received little attention until the mid 1950s when these passenger cells were implicated in the etiology of febrile transfusion reactions and early strategies based on centrifugation were developed to effect their removal In recent decades and particularly in the past five years there has been an accumulation of literature implicating leukocytes in a wide variety of undesirable reactions to blood transfusion White cells are the least numerous of the cellular elements in blood and ratios of white cells to platelets and white cells to red cells are approximately 1:15 to 1:1000 respectively This ratio is maintained in whole blood but may be altered slightly in the process of component preparation Any production or processing step which intentionally decreases this ratio will result in a product which can be described as white cell depleted It has however become more common to define the outcome as a residual white cell content rather than a decrease in cellular ratios although the latter makes more sense on theoretical grounds since depletion of white cells needs to be put in the context of any unintentional loss of red cells or platelets The end result of this intentional processing step therefore is generally expressed as the residual absolute number of white cells or as the degree of difference in white cell content the latter expressed as either a percentage change or as a logarithmic reduction
