The Pneumatic Flow Mixing Method Masaki Kitazume,2016-11-03 The pneumatic flow mixing method was developed to stabilize dredged soil and surplus soil for promoting their beneficial use in 1999 The pneumatic flow mixing

method is a new type of the ex situ cement stabilization techniques in which dredged soil and surplus soil is mixed with a relatively small amount of chemical binder without any mixing paddles and blades in a pipeline. When a relatively large amount of compressed air is injected into the pipeline, soil can be separated into small blocks. When binder is injected into the pipeline, the soil block and binder are thoroughly mixed by means of turbulent flow generated in the soil block during transporting. As this method has many benefits, rapid and large scale execution can be conducted with low cost. It has been applied to many land reclamation projects, backfilling behind earth retaining wall projects and shallow stabilization projects using dredged soils and surplus soils. The book presents the state of the art in the pneumatic flow mixing method and covers recent technologies, research activities and know how in machinery design, construction technology and quality control and assurance. The Pneumatic Flow Mixing Method is a useful reference tool for engineers and researchers involved in admixture stabilization technology everywhere regardless of local soil conditions and a variety in applications.

Fundamentals of Ground Improvement Engineering Jeffrey Evans, Daniel Ruffing, David Elton, 2021-09-17. Ground improvement has been one of the most dynamic and rapidly evolving areas of geotechnical engineering and construction over the past 40 years. The need to develop sites with marginal soils has made ground improvement an increasingly important core component of geotechnical engineering curricula. *Fundamentals of Ground Improvement Engineering* addresses the most effective and latest cutting edge techniques for ground improvement. Key ground improvement methods are introduced that provide readers with a thorough understanding of the theory, design principles and construction approaches that underpin each method. Major topics are compaction, permeation grouting, vibratory methods, soil mixing, stabilization and solidification, cutoff walls, dewatering, consolidation, geosynthetics, jet grouting, ground freezing, compaction grouting and earth retention. The book is ideal for undergraduate and graduate level university students as well as practitioners seeking fundamental background in these techniques. The numerous problems with worked examples, photographs, schematics, charts and graphs make it an excellent reference and teaching tool.
